The pin DDEN (Double Density ENable), pin 26, is grounded. Make it high
and it wil write in FM format.

1318. --> MEGA & UFOST Disczine <--

Newsgroup: comp.sys.atari.programmer
Date: 1998-04-08 00:00:00 UTC
From: Chris Swinson - MEGA Disczine <mega01@globalnet.co.uk>
Message-ID: <6ggl9valv1@heliodor.xara.net>
Source record: 4729

Greetings all ATARI lovers.

Mega Disczine Issue 2 is now out, If you missed issue 1 then goto my site and download it from there. Also UFOST issue 1.

http://www.users.globalnet.co.uk/~mega01/

MEGA Issue 2 is on 2 discs and has over 200 articles covering just about everything we can think of. There should be something there for everyone.

Also UFOST issue 2 is available, Dedicated to UFO's abductions and sightings. Not to be missed if you are interested in this type of thing. This is produced by Lee Round.

If you would liked to be mailed issue 2 of either disczine then send your E-mail address and request it. I will then Mail it to you. Or you can wait until it is uploaded onto my site.

Please contribute to MEGA & UFOST and support it, else it will be one more nail
in the coffin for ATARI. Any articles are welcome, If you have idea on one why not mail me and tell me about it.

All comments and suggestions are more than welcome. Please feel free to mail me at any time. Any support you can give is gratefully received.

Tell me a little about yourself, It will help me in producing MEGA if I get some idea on what people like to read about. Don't hide behind you keyboard, let the world hear you...

Mail me at. mega01@globalnet.co.uk Now for issues.

Please take the time to send a letter to Lee Round (UFOST) else he may not produce future issues, Currently he has almost completed issue 3. Please take time to send him a article or 2, A blank disc is not very encouraging.

If you want issue 3 then send a letter to Lee (not on the net as yet) and request it from him. Issue 3 will be uploaded onto my site, but not for a while.

Send a disc with a S+E to

Lee Round (UFOST)
23 Fellrose Court,
Pelton Fell,
Ch-Le-Str,
Co Durham,
England,

DH2 2QB.

Tell him that I sent you (Chris Swinson).

Additional......

Due to the mass response to both issues, I may have missed a few people who have requested issues. If you have not as yet received what you have asked for then please mail me back, Sorry to all who I have missed.

Thankyou for you time :-)

From Chris Swinson (MEGA DISCZINE)

http://www.users.globalnet.co.uk/~mega01/

1319. ICTARI R.I.P. ?

Newsgroup: comp.sys.atari.programmer
Date: 1998-04-08 00:00:00 UTC
From: augeas@elis.demon.co.uk
Message-ID: <99822651_000034_OASIS_NEWS@elis.demon.co.uk>
Source record: 4730
Cross-posted to: comp.sys.atari.programmer,comp.sys.atari.st

[For those who haven't been following the plot, ICTARI is a disk-zine / user group for Atari programmers.]

Is ICTARI dead ? Not if I can help it, but I'm not sure that I *can* help it. The latest issue is months late due to the slow trickle of contributions.

Want to know why your code doesn't work ? Send it for some constructive criticism. Got a programming problems ? -Ask. Want to share some routines ? -I'd be very gratefull. ICTARI can't continue without the cooperation of others, as the lateness of the new (short) issue shows. I will continue to try an make more back issues available, but surely ICTARI can still be a going concern ? Tell your non-netted friends and user groups, and please send me something worth publishing ! I can't have any enthusiasm unless someone else shows some.

In the meantime, issue 52 is at the usual place:

http://www.elis.demon.co.uk/ictari/ictari.htm

What it does have going for it is Mark Wherry's[1] new iPL scripting language.

Have Fun,
"Augeas"

[1] Mark, my mail to your HotMail account keeps bouncing.

>> .
ib> Erm My 520 STFM that originally has a single sided floppy drive DID
ib> have TOS 1.09,

From what I've read this is incorrect - there was /no/ TOS 1.09; it's
just that some programs that tried to read out the TOS version got it
wrong! This was in fact TOS 1.02 which first appeared on the Mega ST
and supports the blitter. It came with GEM 0.19, which may be the
source of the confusion.

ib> TOS 1.02 is often mentioned as TOS 1.2
ib> TOS 1.04 (Was in another dead ST i found) is sometimes confused with
ib> TOS 1.4 TOS 1.4 is also called 'Rainbow TOS' as it has a multi
ib> coloured atari symbol in the desktop info bit.
ib> TOS 1.6 in in STEs and the last STFMs(the ones that has blitters) is
ib> sometimes confused with TOS 1.62

TOS 1.6/1.06 was in the early STEs (520 & 1040).

ib> TOS 1.62 is in 99% of all STes
ib>
ib> Please correct me if i am wrong in any of this but it is what i have
ib> learned after doing atari stuff (not on www) for the last 6/7 years.

Yes, that's OK. The TOS version can be read with a memory editor at
_sysbase+2 longs (16 bytes), which is $FC0002 with TOS 1.xx, in binary-
coded decimal format. That will read 01 00 / 01 02 / 01 04 / 01 06/ 01 62
etc. Some people thought that the second byte should be read reversed, in
the Intel order, and it wasn't until the minor change from TOS 1.60 to
1.62 came about that people realised this was incorrect. Atari themselves
weren't all that logical about it -- I never understood why they didn't
put the TOS version into the Info dialogue instead of just the
copyright dates...

Regards
/Peter/

I hate to spoil your idea, but have you ever given it serious thought
what kind Atari you would need to run that ? Or will it be smth for
"future platforms" (like in the PC-world) ?

However, their might be some interesting things buried in that code...
...if you can read it... ;-)

I did some work on a program like this. You can find complete documentation
for RTF format on MicroSoft's web site. There is *NO* published spec for the
DOC format, MicroSoft keeps that private. You might be able to find some
info from a web search; I haven't tried that.

RTF conversion to HTML is pretty easy for the most part; I couldn't decide
what to do about embedded figures/drawings/graphics. I suppose the simplest
thing to do would be to render it into a 100dpi GIF file or something and
spit it out as a separate file.

>Thanks for the help.

Hey! Phil Carmody <papc@techprt.co.uk> wasn't it Mon, 06 Apr 1998
20:05:50 +0100 that you wrote:

>Firstly, it's not so much a legal issue, it's more of a moral issue. In
>several countries piracy is legal. However, the residents of that

If it's legal then why do they call it Piracy ?

>I also believe in some ways that products which are no longer sold by a
>company or its distributors, (deep breath) have no value to the company.

But they do have a value to people who own legally bought copies.....

>actually a lesser form of piracy than it is for a (presently) commercial
>product.

If it looks, smells, sounds and tastes like Piracy.. then chances
are.. its Piracy...no lesser or bigger, its all the same thing..

>You do realise that typically 2nd hand software is illegal, don't you?

Define typically and what laws you refer to.. Reselling in the UK is
NOT illegal.....Also when people pirate software, do they restrict
there piracy just to certain countries? I doubt it..

>Who's looking to buy a 2nd hand copy of GFA basic - anyone wish to aid
>and abet me in this crime?

I have seen adverts in this newsgroup many times from honest ATARI
users who want to sell a copy of GFA that they bought and no longer
need.. If GFA is now put out in pirated form then all our fellow GFA
owners will lose out... not fair surely ?

>
>PS. Anyone got a GFABasic -> C converter whilst I'm about it, or do I
>have to write one myself? (I have thousands of lines of GFA stuff I
>wrote when I was a wee nipper with an ST, but now I'm a C boffin)

Then why not make something instead of promoting piracy ?

There are other good reasons NOT to pirate software, for a start it
doesnt exactly help those of us still here programming... what chance
have we hobbyist making software if the internet gets flooded with
commercialy quality software for free download..

The trouble with Piracy is that the pirates are only thinking of
themselves.. not of existing programmers or honest people who own
software or the community they invade..

The ATARI platform does not want an influx of pirated software, and
you arriving in this newsgroup and telling everyone its right is just
showing that you don't care for the ATARI community....

Cheers - Tony Greenwood (ATARI Programmer) paxton@zetnet.co.uk

1326. Help : palette Degas Shifter vers VDI

Newsgroup: comp.sys.atari.programmer
Date: 1998-04-09 00:00:00 UTC
From: pierre.tonthat@hol.fr
Message-ID: <6gjcin$6vu$1@news2.isdnet.net>
Source record: 4737

Salut a tous.

J'ai un big probleme a propos de la conversion de la palette 16
couleurs shifter (type celle du fichier PI1) vers le format VDI.
Ca donne :

```
SEEK #23,2
BGET #23,m_color1%,32
FOR i%=0 TO 15
dummy%=WORD{m_color1%+sft2vdi&(i%)*2}
INT{m_color2%+i%*6}=INT(AND(SHR(dummy%,8),&HF)*1000/7)
INT{m_color2%+i%*6+2}=INT(AND(SHR(dummy%,4),&HF)*1000/7)
INT{m_color2%+i%*6+4}=INT(AND(dummy%,&HF)*1000/7)
NEXT i%
```

avec

```
DIM sft2vdi&(15)
sft2vdi&(0)=0
sft2vdi&(1)=15
sft2vdi&(2)=1
sft2vdi&(3)=2
sft2vdi&(4)=4
sft2vdi&(5)=6
sft2vdi&(6)=3
sft2vdi&(7)=5
sft2vdi&(8)=7
sft2vdi&(9)=8
sft2vdi&(10)=9
sft2vdi&(11)=10
sft2vdi&(12)=12
sft2vdi&(13)=14
sft2vdi&(14)=11
sft2vdi&(15)=13
```

La resultat est completement aberrant. certaines couleurs sont les
bonnes, mais pas toutes.
Quelqu'un pourrait me mailer la sol ? Please ! C'est pour que ca
marche sur les compatibles Atari, au sujet d'un editeur de tableau
16*16 cases, pour bricoler un jeu par la suite.

Bye !

That is true, but how many virtual machines have we got ? Maybe this is
important for other platforms, but for us (me at least ;-)) it is more
important that sr read access being priviledged can be a bad handicap.

: An ftp URL would be great.

: My last question : do lex, yacc, bison or flex exist for Mint ?
: Again : where do I find them ?

I'm not really the right person to answer this as I'm not very familiar
with KGMD, but since nobody else has... I believe all that stuff is in the
KGMD compiler package. I think you can just untar the compiler package and
copy the extra items into your existing system. Someone else can tell you
where to get the most up to date versions, the compiler in the KGMD is
very old. Maybe you would be better off posting to the MiNT mailing list,
I can't remember how you subscribe but you should be able to find out at

http://aire.ncl.ac.uk/Atari/Mailing-Lists/MiNT-List.index.html

hi, in order to work on a cpx I need some info about it.
I am not using C, so the cpx header or lib that could exist won't
help directly.
I need to know this: How do I embed my window(fixed w and h as
someone told me (but don't remember the value off hand)) into the
control panel?
what if I move the control panel? what wm_moved message do I get?

(the header for the cpx is not the prob itself), I just need to know
about the redraw, move and parent tree.
Anyone helps me?

Thanks.

> floppy-disks?

I think it depends on the atari computer your using. I use a mega/ste and I transfer files between my dos machine and the atari all the time. I usally format the disk in the IBM. I find the only times it don't work is when I make directories on the disk or delete some files from it. If you could fromat the disk in DOS format copy the file to it and do nothing elase it might work. Also, I think there are programs out there which allow atari computers to read dos formated disks. Don't hold me on that though. If you've got internet access search some of the shareware search sites.

Scott.

: that should be used within RSC-files. Secondly, does

No idea. Sorry.

: anyone know of a program that could be used to create
: icons or/and buttons in these formats.?

Yes. "Zoom" is designed to develop icons in RSC files. It can even import
(or export, I'm not sure) Windows 3.x iconfiles.
"Interface" kan incorporate images in RSC files (might be .IMGs) AFAIK.

Regards,

1336. --> MEGA & UFOST Disczine <--

Newsgroup: comp.sys.atari.programmer
Date: 1998-04-11 00:00:00 UTC
From: Chris Swinson - MEGA Disczine <mega01@globalnet.co.uk>
Message-ID: <6gol9easj1@heliodor.xara.net>
Source record: 4648

Greetings all ATARI lovers.

Mega Disczine Issue 2 is now out, If you missed issue 1 then goto my site
and download it from there. Also UFOST issue 1.

There has been a few bug reports mailed to me so this issue is the NEW
version, V1.1
Bugs are mostly end of files been cut off and a few files which were missing
off the disc. A few other Shell bits have been updated as well.

http://www.users.globalnet.co.uk/~mega01/

MEGA Issue 2 is on 2 discs and has over 200 articles covering just about
everything we can think of. There should be something there for everyone.
If there isn't then why not write about it or suggest new pages. If you
don't then we won't know will we !!

Also UFOST issue 2 is available, Dedicated to UFO's abductions and
sightings. Not to be missed if you are interested in this type of thing.
This is produced by Lee Round.

If you would liked to be mailed issue 2 of either disczine then send your
E-mail address and request it. I will then Mail it to you. Or you can wait
until it is uploaded onto my site.

Please contribute to MEGA & UFOST and support it, else it will be one more
nail in the coffin for ATARI. Any articles are welcome, If you have idea on
one
why not mail me and tell me about it.

All comments and suggestions are more than welcome. Please feel free to
mail me at any time. Any support you can give is gratefully received.

Tell me a little about yourself, It will help me in producing MEGA if I get
some idea on what people like to read about. Don't hide behind you
keyboard, let the world hear you...

Mail me at. mega01@globalnet.co.uk Now for issues.

Please take the time to send a letter to Lee Round (UFOST) else he may not
produce future issues, Currently he has almost completed issue 3. Please
take time to send him a article or 2, A blank disc is not very encouraging.

If you want issue 3 then send a letter to Lee (not on the net as yet) and
request it from him. Issue 3 will be uploaded onto my site, but not for a
while.

Send a disc with a S+E to

Lee Round (UFOST)
23 Fellrose Court,
Pelton Fell,
Ch-Le-Str,
Co Durham,
England,
DH2 2QB.

Tell him that I sent you (Chris Swinson).

Please support MEGA NOW, If we don't get some REAL support for issue 3 then we may not produce another zine, Its up to you .

If you would like to help but don't know how then please feel free to ask me waht you can do.

From Chris Swinson (MEGA DISCZINE)

http://www.users.globalnet.co.uk/~mega01/

>KGMD compiler package. I think you can just untar the compiler package and
>copy the extra items into your existing system. Someone else can tell you
>where to get the most up to date versions, the compiler in the KGMD is
>very old. Maybe you would be better off posting to the MiNT mailing list,
>I can't remember how you subscribe but you should be able to find out at

You can "update" the KGMD very easy! cat all files together und untar them.
(cat compiler.a* | gzip -dc | tar -xf -) after them you got the usr/ and
var/ tree including all the files you need. The next step is to update the
old (2.5.8) binarys/libs with the new compiler (2.7.2) in the binary and
the lib dirs.

Don't know where to get the new files 'cause i have all on CD :-) but search
for it with any searchengine.

bye

> Therefore to pay nothing is to pay what it is worth. i.e. Paying
> nothing, or 'piracy', is actually a lesser form of piracy than it is
> for a (presently) commercial product.

Firstly, Lattice C at least is still sold commercially. Secondly, the amount of damages a company may sue for a copyright breach would depend on the country. In the UK the courts would only award compensation and that is based on the amount of money the company have lost due to the copyright breach. However, in the USA and some other countries the copyright holder can be awarded punitive (or punishment) damages this would add up to a lot of money, the amount would depend on the means of the thief since the award is designed to punish.

> You do realise that typically 2nd hand software is illegal, don't
> you? Look at the license agreement for most software - you can't pass
> on the license to a third party.

Any such statement is invalid. Copyright only covers the copying of software it does not cover the sale of materials that it happens to be resident on. Selling software second hand is like selling a book.

> If you look at copyright over software in a similar way to trademarks,
> it's only illegal if the owner enforces it (no, I'm not suggesting
> companies pay to enforce it. i.e. that they exercise the copyright by
> still making copies, or by distributing it as (non-free) shareware.

This is of course true.

> Hey, I just want to be able to scavenge in the dustbin for stuff
> that's past its sell by date.

The expiry of copyright is 75 years after the oweners death.

> Who's looking to buy a 2nd hand copy of GFA basic - anyone wish to

1342. setinterrupt(src_inter,cause);

Newsgroup: comp.sys.atari.programmer
Date: 1998-04-13 00:00:00 UTC
From: arjanbok@pop.xs4all.nl
Message-ID: <6h0emk$jj9$1@news2.xs4all.nl>
Source record: 4653

Is there anyone who has used the FALCON soundsys call:
long setinterrupt(src_inter, cause) ?

According to the developers toolkit it is supposed to set
up either a timer A or a MFP i7 interrupt.
But when i try to use it in an audio player program of mine,
I can only detect one MFPi7 interrupt. I thought it should give
a interrupt every time the play or record pointer hits the end of
the buffer. But it seems like it only occures when the playback or
record is stopped by changing the buffoper mode.

I want to use this interrupt if posible instead of having to check
the pointer continously to pass the half of the buffer before
refilling it.

regards, arjan

Hmm, I just thought. My C++ is pretty poor and I've not used try/catch
myself yet. However, C++ Bulder wraps a Windoze application up in one.
If I understand it correctly then C++ will unwind the stack to whoever
catches the exception but it'll also have to call all the appropriate
destructers? If so, how do you simulate those with setjmp/longjmp?

(free'ing dynamic memory is what I'm thinking of rather than the local
stack frames)

>us to run into features like this.

A method I've used to good effect in the past is to put the speed
critical sections into their own function(s) but keep them as C until
the program is debugged and working. Then I replace those functions
with asm. The original C versions can always be used for an initial
port to another compiler (or machine I guess).

[snip 1st bit]

Use the "environment" pointer of Pexec() when you execute PGP to set
up the password variable and value. When PGP returns the old
environment will be restored. (Ideally you should duplicate the entire
environment and add your bit in).

I certainly agree which is why I almost always choose to use unsigned
bitfields. Sometimes (very rarely) it is handy to have a signed
multibit bitfield though.

>I don't quite know about ANSI C though.

I see. It looks like there might be a (deliberate?) oversight in Mwc.
Okay, you say that a bit field is not an "int" but "unsigned" is taken
to be "unsigned int" thus it follows that the natural size for an

"unsigned" bitfield would be sizeof(unsigned int) anyway. I dunno!

>> have the impression that ANSI only allows "int". I could be wrong

This is good to hear. Signed bitfields are not as useful as unsigned
ones and don't make a lot of sense for fields which are only one bit
wide!

>if all you wanted to find out is if you run in Super mode ...

Certainly on Atari systems as entering superstate is permissable. I
would hazard a guess that such abilities are extremely rare on other
systems.

Yeah. If I'd thought about it a little more. After all my waffling
about fields in structures and how they *might* be represented, then
there wouldn't be any particular rule on how bitfields were
represented either!

You pass it to shel_write() in the same way as for Pexec().

Have a look at my other response in this thread. In fact there is no
need to use shel_write() at all. If you've disabled the PGP output and
your program has to wait for PGP to finish then there's no point
launching PGP as a parallel process in the first place, so Pexec()
will do just fine. :-)

```
You have to tell the MFP that the interrupt is served
Example:

asm{
bclr.b #7,0xfffffa0f ;tell MFP that the interrupt is served
rte ;return from exeption
}

and here is a working initiate code

/*****************************************************
Description : Init end-of-sample interrupt

Entry : None
Exit : None
*****************************************************/
int init_sound_interrupt()
{
long adr;

Jdisint(15);

old_sound_vect = xbios(0x0d,15,EndOSINT);

setinterrupt(1,1);

adr=Super(0L);
asm{
bset.b #7,0xfffffa03 ; set active edge in MFP
}
Super(adr);

Jenabint(15);

}

and a working restore code

/*****************************************************
Description: Restore and disable end-of-sample interrupt

Entrys : None
Exit : None
*****************************************************/
int restore_sound_interrupt()
{
long adr;
Jdisint(15);
```

```
adr=Super(0L);
asm{
bclr.b #7,0xfffffa03 ;active edge in MFP
}
Super(adr);

if(old_sound_vect != 0L)
{
xbios(0x0d,15,old_sound_vect);
old_sound_vect = 0L;
}

}
```

You can't automagicly deallocate allocated memory with the C try...catch
implementation using the setjmp() longjmp() functions, wish it could.
You have to deallocate malloced RAM yourself. Every malloc() free() pair
has to be allocated within a try...catch block so you can free the
allocated RAM on exceptions and then rethrow the exception.

I am using macros like
#ifndef NOT_USE_STD_find_dictionary
around functions (here find_dictionary). If the macro is defined
the standard function is replaced by an alternative one. It might
be an assembley version, or an optimized C or whatever. As long
as the linker can find the alternative function all goes well.

The macros are comming from a headerfile with settings. There
every system and compiler can define which original functions
to keep and which to replace.

Cu, Hans

OK, guys, here is my little contribution to the subject:

I've own Ataris for mor than 10 years, it is IMHO one of the best designed computer systems of all times, but, as time goes by so computers, i don't own PC's, but i work with them all day long, the main reason i don't wanna buy a PC is the tech groundbreak, i've been thinking buying one just because i want APE for my Atari, anyhow, i don't think Hasbro or anyone will take the A8 out of the basquet, the many out there who own one of the newer game consoles know exactly why, in the meantime we are seeing a resurrection of old 8-bit tiltes, the last one, i think, is robotron for the N64.... So, games we will see lots of resurrections, systems, i don't think we'll see any.... Still, i buy any piece of A8 hardware that crosses my path.

Javier.

The copy of K&R v2 that I looked in (a Swedish translation) stated clearly
that both unsigned and signed int are OK as bitfields.

>>any sense. A bit is unsigned by definition; a signed one would mean the
>>one bit is taken as the sign, and zero bits for the absolute. That's silly
>>isn't it ?

What's silly is the idea that C would use sign-magnitude integers!
I know there have been one or two computers that have done that, but it's
_very_ uncommon.
All modern computers use two-complement integers, where a single bit can
well be signed (with the possible values -1 and 0).

>>> Mwc accepts both unsigned and signed for bitfields and the sign is
>>> taken into account. ie "int fred:1" when set to any non zero value
>>
>>The compiler should not accept this, as a bitfield is not an "int". Note

>>
>> unsigned fred : 1
>>
>>and not
>>
>> unsigned int fred : 1

In C, 'unsigned' is a synonym for 'unsigned int'.

The K&Rv2 I checked clearly states that bitfields must be specified as
'int' and it recommends adding 'signed'/'usingned' for portability.

If you decide to 'go PC', I suggest trying Linux or
FreeBSD first. They, as unixen, tend to be a bit
harsher on newcomers but, they're much more reliable
than WinXX and perform better (more responsive) on
similar hardware. You will likely be quite shocked
with how much computing horsepower it takes to just
do basic computing with WinXX.

I am running Windows 95 on a 486DX-66 and it runs decently. Seems almost as responsive as my Macintosh at work (7200/75). I run Microsoft Office products and have never had a complaint about performance.

I would like to try Linux but it does seem intimidating. Also, where does one get software for it (like word processing, graphic)? This is an honest question.

I think you can do it by doing this (Anthony, correct me if I'm wrong):

```
wind_set(WF_ICONIFY,-1,-1,-1,-1);
```

I have not tested it my self, but I think this works.

There's a free (not for profit) office suite called Star Office
available for Linux. I've got it, I use it very occasionally. I end up
using Word 97 more often because I don't get the same quality print in
Linux that I do in Windows. I'm using a Canon BJ-200ex. Printing in
Linux is primarily done with postscript, so if you have a postscript
printer you should have no problem. I, on the other hand, don't so I
have to use a postscript filter (apsfilter) to make it work with my
printer...and then I have to use a BJ-200e driver (which is half the
resolution).

StarOffice is not bad. It supports conversion of various format
documents (albeit, not Word 97, but will do Word 6.0). It has everything
you'd expect in a word processor. I especially like having the
mathematical formula editor...which comes with the package.

The major linux vendors distribute it (like Redhat or Caldera)
and you can find it in places like *linuxmall*. For games that
have been 'un'released, you can just pick up the game at CompUsa
and download the Linux version of the executable (QII, UO).

There's also a 'freeware' ST emulator called STonX that
you might want to try out. You'll have to provide ROM
images however (not hard to find on the web).

Linux will likely run more responsively on the hardware
you're using now. Although, unless you have lots of ram,
I would not expect much out of either '95 or linux.
Although Linux is a lot easier to trim and tune.

I never found the performance of M$ OSes to my liking.
I also found the registry and plug-n-pray quite annoying
as well.

oic! In this case send yourself a WM_ICONIFIED message with msg[4..7]
set to -1 (or simply wind_set(WF_ICONIFY,-1,-1,-1,-1) but the first
method is better imo). When you get the WM_UNICONIFIED message simply
interrogate WF_PREVXYWH then pass those values to
wind_set(WF_UNICONIFY).

Eagle will be nice and all. However, most Atari's
still floating around now are still limited to 4M
which for GEM is nice but for Unix even in curses
mode, it's a bit cramped. That's just the RAM,
mind you, and not even getting into storage...

I have seen Redhat at Electronics Boutique. The problem I might have with
Linux is that I only have a 500 meg hard drive.... Are these commercial
versions easy-to setup as, say, other major OSes? Like a nice setup
program?

>
> There's also a 'freeware' ST emulator called STonX that

I have heard good things about it. Does it allow different resolutions
other than the three standard ST ones?

If by trimming and tuning I have to wade through tons of configuration
files, I am not sure I want to. Are many packages for Linux "complete" or
do you have to compile most packages yourself? Sorry I am so clueless on
Unix.

>
> I never found the performance of M$ OSes to my liking.

The registry is fairly easy to configure, IMHO. Also, for some odd reason
(I know I am in the minority), Plug-n-Play has worked flawlessly for me.
Windows detected all of my components and I had no conflicts. Strange ;-)

Thanks for all the responses and help!

Run 'nicely' is not something I would describe of
any version of Windows. They're far too bloated
for too little actual functionality. Until I switched
to Linux, I was constantly contemplating an ST
emulator so that I could run more efficient (yet
useful) applications.

That fixation is gone. (although STonX is still
kinda nifty)

Yup. Hardware configuration is more Win 3.1ish. There is
some plug-n-pray but that's primarily with PCI devices.
Whether or not this is a good thing tends to correlate
to one's Win95 experiences (good or bad). For LInux,
500 may be a bit tight. I would expect it to be tight
for Win95 as well. If you dont have any intention of
using the linux dev tools are some of the more hardcore
unix utilities (like tex) you should be fine.

Yes, there is configuration overhead. Unix is a system
where you boss around the OS, instead of vice-versa.

Win95 did detect my 2nd CDROM drive, my tape drive & still
doesn't have a proper driver for it, didn't have a useful
monitor type for my monitor & misconfigured my ethernet
card disabling my modem in the process. Yes YMMV.

The registry is too prone to corruption & not a help to me
as I would be directly modifying it anyways to bend the
machine to suit me.

pt> I was speaking about the atarian FIRST WORDPLUS file format.
pt> Really don't need to take the path to heel exploring the M$Word00
pt> file format.

Many years ago (1989) GST (who sold 1WP) published a /1st Word Plus/
/Software Developers' Guide/ that had all the info you need. Long out of
print, but I could sell you my copy for what I paid for it then, 3 UKP if I
recall right, plus postage. Or 12 International Reply Coupons. :-)
If you are only after the text styles, then you can read about it in the
IdeaList manual. It uses a similar arrangement except that it shifts the
Escape characters down by $20 so that they can be typed from the keyboard

Alternatively, take a look at the Shareware TUC universal converter, which
has a module for 1WP conversion included. Studying it will tell you what
substitutions are necessary.

Regards
/Peter/

At present I'm passing it on the command-line. However this way restricts
the maximum length of the password to 26 chars, and the email addresses to
32 chars. While this may be long enough for PGP to distinguish between the
names/addresses, I don't think that the password is long enough. I'm just
doing a small rewrite of that part to extended the length to 48 chars, which
I think is about right, and pass it via the environment instead. If it
works, I'll lengthen it to a maximum of about 62 and do it that way.

I did manage to get the output from PGP down to a bare minimum. It still
displays a single message on-screen to say it's created the clear-sig.
Apart from that, there is no other output, even for a password error.
Instead of displaying an error message, it just quits, and since I'm
ignoring any errors from PGP ATM, it is as though PGP wasn't called. I'll
put something in to let the user know if, and what type of, error occured
later.

The last step wont work very well if you of some reason have moved the
iconified window (or maybe this is a special case?). So it's better to
save the position before iconifying it like Anthony said.

Student <student@pczaal.utwente.nl> wrote:
>looking voor a list of conversion program with the new Motorola syntax for
>the GNU assembler.

Am I correct in assuming that you want to assemble 'normal' mnemonics
under GAS? If so, there is a program for such conversions in the MiNT
source distribution (it's probably available on its own somewhere as well).

The GAS m68k assembly syntax is not the new Motorola syntax, by the way.
I don't know why anyone would have wanted to invent something different
for GAS (especially since it also supports something that looks much more
like the 'standard', if you compile it with the right settings), but IIRC
it's usually called MIT syntax.

The new Motorola syntax is
move.w 14(a0),d2 -> move.w (14,a0),d2
move.b d0,temp -> move.b d0,(temp).l
and so on.
Does anyone happen to know of an Atari assembler that handles the code
to the right above, by the way?

>What is the meaning of things such as 'moveml a6@,#0x43c' or 'jra
>0x16584'?

The '@' is the GAS way of doing indirect addressing.
GCC does not create normal register lists for MOVEM for some reason, but
rather gives the extension word (with a bit for each register) directly
(GAS can handle register lists just fine).
Hexadecimal numbers are given with '0x', like in C, instead of the usual '$'.
IIRC, GAS handles all the usual branch mnemonics, but it also has a
couple of extra ones that are used by GCC for some reason.

>What is the new interpretation of the 'old' mnmonics 'movem.l' of 'addx.l'?

I think (normal) GAS will throw an error for those, or possibly interpret
them as labels.

1392. TOS calls that alter their stacked params

Newsgroup: comp.sys.atari.programmer
Date: 1998-04-18 00:00:00 UTC
From: gmiller@inca.co.nz
Message-ID: <6h9f9mkvr1@newshost.comnet.co.nz>
Source record: 4554

Are there any TOS calls (GEMDOS/BIOS/XBIOS) that obliterate any of their stacked parameters?

Given a TOS call of the form:

```
pea address
move.l #datum,-(sp)
move.w #funcnum,-(sp)
trap #X
```

can I rely on the stacked funcnum and address remaining untouched?

(I am thinking of a code optimisation whereby a number of similar OS calls in a row can use the already stacked parameters and just alter the function number [or vice-versa: keeping the func num the same but altering the stacked parameter] before issuing the next trap call to the OS)

So the above example may be followed by:

```
add.l #itemsize,2+4(sp)
trap #X
```

without having to :

```
pea address+itemsize
move.l #datum,-(sp)
move.w #funcnum,-(sp)
trap #X
```

(ie: datum and funcnum remain the same)

It seems OK on my TOS 3.05 TT, but, as I no longer own any other Atari 68k system, I am unable to test my ideas out

--

All email sent to my inca address will fail, however I can now be contacted via an intermediary : gem at tos pl net. I would like to apologise to the genuine respondents that this may inconvenience.

I haven't personally installed Redhat before, but I've heard it's a good
installation. 500 meg should be plenty (I used to use Slackware and
XFree86 on a 500 meg drive and I still had room to spare).
>

As an end-user I had to reconfigure the kernal to support my hardware,
and if I wanted to connect to the internet, I had to write my own script
to connect to my provider and start the pppd daemon. There are books
that explain this, but they aren't terribly clear. Also configuring
XFree86 (the Xwindows) can be a real pain in the butt. Other than that,
that was about it. :)

LINE-F is used by the FPU, if one is installed. Otherwise, any LINE-F
call will give 11 bombs.

Greetings,

Hi everyone :)

Has anyone thought of porting descent from interplay to the falcon?

after all it runs quite well even on 386 sx machines and only requires 4mb of RAM and to top that it only uses around 128 colours!

The falcon, especially ones with co processors would be easily capable of it

(only just thought of this because i have borrowed a 33mhz 486 (no floppy drive) to play against a friend in death match.

i don't know anything about this sort of programing but it sounds like a good and possibly popular idea

:) Ian Norton

1397. Resolution change. How?

Source record: 4559

Hi there,

I wonder if anyone know how to change resolutions in the correctway in order
to let the OS know about it restart the AES and reload the ACCs?

The thing is that I'm writing a resolutions changer for the Nova cards but
I can't get it to work properly. How is it realy ment to be done and when
should I do the physical resolution change?

I think I have got a problem as I can only do a immediate resolution change
on the Nova, so I have to change resolution before my program exit. The thing
is that I think it's the AES which sets the resolution just before it restarts.

I guess this all sounds wacky and it is. :-)

Any ideas anyone? Or does such thing exist for the Nova cards?

Not exactly true. Earlier TOS versions (upto 1.4(?)) (mis-)used LINE-F in
the AES part to squeeze a few bytes out of it. But this was as internal
as you can get, and you won't find any docs about that.

The GEM-list keyboard standard (more or less agreed to years ago and used
mostly by the Germans but also by others) uses CNTL-D for Diminish a window,
that is, iconify.

There was an Atari standard keyboard short-cut list which hardly any one
adopted. I think the list in TAC and MASS is this one.

However, this list already conflicted with standards emerging from Germany
and so a group of commercial, shareware and PD programmers got together on
the Internet in 1994 to agree on an alternative set of keyboard equivalents
which became known as the GEM-List Keyboard Short-cut Standard.

Table K2: GEM-List Keyboard Equivalents

Key combination Meaning
[Cntl-I] Show Info about selected object

Window Manipulation
[Cntl-Tab] Cycle windows
[Cntl-W] Cycle windows

1404. Need information on the VA Protocol

Newsgroup: comp.sys.atari.programmer
Date: 1998-04-20 00:00:00 UTC
From: thomas.sahlin@home.se
Message-ID: <6hg67ujnn1@cubacola.tninet.se>
Source record: 4566

Hi there!

Can anyone give me a hint on where I can find information concerning the
VA Protocol? I downloaded a copy of Gemini somewhere, but that package did
not offer any programming manuals.

Regards

Thomas Sahlin

> control panel?

The CPX "contents" are a usual resource tree as saved by all Resource
Construction Sets. Most of those allow saving the tree as C source code
which you can use to include the tree into the binary (a must for a CPX).

Upon loading, the CPX binary returns a list of function pointers to the
CPX server. For most CPXs, only one pointer is important, which is the
one to be called when the CPX is invoked by the user. As a parameter to
that function, the CPX gets a pointer passed that points to a structure
with all sort of important information, amongst those the info needed to
objc_draw() the tree into the window.

> what if I move the control panel? what wm_moved message do I get?

None. The CPX server handles that bit. The CPX only gets a REDRAW message
when necessary.

Joakim Hi¿½gberg <fiolerna_BULKMAIL_SUCK_@algonet.se> writes:

> I wonder what kind of image types (ICN, IMG, or other)
> that should be used within RSC-files.

You can use whichever you want, depending on how you want to use that resource tree. Usually your program will want to display it using the AES objc_draw() call, for that you need to use the special image format used by AES. This format is entirely internal to RSCs and has no name.

If you use some other display code that objc_draw(), or if you set the OBJECT.ob_type to G_USERDEF, you can design your own image format or use any existing one.

> Secondly, does
> anyone know of a program that could be used to create
> icons or/and buttons in these formats.?

Most resource construction sets will place images into RSC files only by using the special AES format mentioned above. Images loaded from ICN or IMG files will be converted by those RCS.

It's the OS' task to keep track of x, y, width and heigth for the iconified
windows. IIRC there is a wind_get() call sub-code for inquiring this.

Most people consider this one of the many bugs in AES 4.1. No docs I've
seen mention this as required. So basically this is one of the many work-
arounds we'd need to add to keep the intrepid users of AES 4.1 happy.

A program that allows iconification from a menu but as no ICONIFIER gadget ?
Very confusing, mildly stated ;-) You should adjust the wind_kind parameter
to contain the iconifier too.

IIRC, with TOS 1.00 the LINE-F is used internally for GEM AES and VDI calls.
I don't know where it changed to bombs, but with 1.62 it does.

ST Internals (Abacus) gives a bit of info about it, saying that it contains
self-modifying code. The idea was that a single 0xf??? opcode, with bit 0
set, replaced the following code:

tst.l (a7)+
movem.l (a7)+,dx-dy/ax-ay
unlk a6
rts

The dx-dy and ax-ay were selected by ANDing the opcode with 0x0ffe, and
left shifting 2 bits. By copying this word into the LINE-F code, the movem.l
could 'unstack' any of the registers between d3 and d7, and between a0 and
a5.

If bit 0 of the opcode was clear, it was taken as an offset in a jump table.
The jumptable entries corespond to 0xf000 to 0xf9cc. What each of these did
is anyones guess.

Hello everyone,

Tab does anyone know where I can locate a decent movie player for
MPEG, AVI, e.t.c. I got one here and am using on a mega/ste with 2 megs
of RAM but it very seldom works and usally only in greyscale when it does.
I also have a copy of 1st guide, but this displays the movies very pixely.
If you stand back from the screen about 7 feet you can sort of pick out
the movie :) and greyscale is hopeless in this as well. Anyhow if anyone
has any ideas on where to locate a player/multi-media program, please let
me know.

As well, what kind of RAM fits thte MEGA/STE. I really don't want
to open it and look at the sockets to determine. Can simms fit it?

Scott.

Try browsing through the ICTARI disks at
http://www.elis.demon.co.uk/ictari/issues.htm

You'll find stuff in GfA Basic for the VA protocol (and more) on number 39
and 41
PS. if you are a programmer who likes to share his work with others, please
also think about uploading some stuff to e-mail: augeas@elis.demon.co.uk

Hope you find what you're looking for,

Theo Ros (theo.ros@rnw.nl)

Only if you help us out !

I am currently working on issue 3, We have had some new members to support the new zine but I am sure there are a lot of you out there how would like to write somthing.

If you would but dont know how, then write a articles for the WIBBLE section of MEGA. Simply keep typing the first things that come into your head for a line or 100, and mail it to me.

Have any ideas on stuff to include, I like to hear from you.

Sorry to all those people who are waiting for MEGA to appear on my site, It should be there shortly. I will mail it to people who request it.

If you have already got MEGA, Make sure you have got the disc_1a.zip and disc_2a.zip files, The ones without the "a" are a faulty version. This was mailed in a almighty cock up on my part. The main problems are bottoms of files missing, a few not on the disc and the music will not turn on if you turn it off.

Anyone who I sent my questionnaire to , all have now been removed from the mailing list as they have not given permission for me to keep them on recored.

Please take a few moment to send your support to MEGA, I know there are a lot of readers out there, so Keep the mag going and offer your help. Support you ATARI computer, don't hide behind your keyboard, let the world hear you !!

ATARI FOREVER

Like Ben said Aniplay works very well as does M_Player. Remember you
only have 16 colors however.

Your STE will accept standard 30 pin simms, 8 or 9 chip. Even 100ns
would work, I guess to a point, the faster the better. If you already
have two megs, you just need two more simms.

Mike

Linux 68k currently uses some code from FreeBSD, thoughit's not in the
official source distribution because the BSD liscense and the GNU liscense
are not 100% compatible. My guess is that with some modifications for the
lowlevel stuff the FreeBSD could be adapted for TOS as well, although most
TOS programs don't rely on an FPU...
The code used in Linux/BSD can be found in the Linux 68k FPU-emulation code
patch on the NoCrew FTP site.

Thanks all for your help on this subject.
It has made me find my bug, which was not decrementing the Program counter by 2 before creating the stack frame.
Result: instead of analyzing the Line-F code, an arbitray other value was being analyzed...

Marco

GFA has some inbuilt commands for this. If I remember correctly they are
DMASOUND, MWOUT, STE?, TT? or something like that. I can give you a more
detailed description if you like.

No, but there must be one. It is certainly trivial to do on an ST(e)
with Setscrn(), Getrez() and a Degas image.

>and play a sound on boot for a falcon 030?

Sorry, I've never done a thing with sound!

>if possible same
>for shutdown (magic5)

Yes but it probably would be a little more involved.

It's an obvious bug in my opinion Anthony. Imagine this ... there you
are with an iconification message, you close the window then horror of
horrors the window will not open again! Same problem in reverse.

Yes, it wouldn't surprise me if it did. Saving PREV somewhere
immediately after iconification would be a wise precaution.

>And I guess you work with Magic (and again IIRC, from my tests, I couldn't

I don't know. Iconification is a mess so I keep it simple. I use
wind_set(WF_ICONIFY,msg[...]) when I get the iconification message and
wind_set(WF_UNICONIFY,msg[...]) when its counterpart is received.

>So it's better to
>save the position before iconifying it like Anthony said.

He's most likely right. I didn't think of it as I whipped up my
example! Iconification should never have been left to the programmer
in the first place - it is a system function and the only part the
programmer should play in it is to have the ability to ignore the
original iconification message. I'm not even sure if the uniconify
message ahould even be "visible". Depends on the implementation.
Anyway, we're stuck with it as it is. ;-|

Hi,

I wonder if anyone else using Lattice C has got this problem.

If I compile a program and then set the load program into
Fast-RAM flag, my program takes up twice as much memory!

Has anyone noticed this????

Am I the only one with this problem?

Am I the only one who has got Fast-RAM and wants to use it?

Anyone???

Perhaps you could try a different emulator - Pacifist perhaps? I
haven't heard of any problems with using Lattice C or PureC with
MagicPC - well no more than with standard MagiC anyway. Mark Williams
C (which is command line based) certainly works with the demo, so I
would expect Sozobon and GNU would also.

1439. Your Input Needed: How Would YOU Improve TOS/GEM?

Newsgroup: comp.sys.atari.programmer
Date: 1998-04-26 00:00:00 UTC
From: strads@tmisnet.com
Message-ID: <35428cad.2265235@news.tmisnet.com>
Source record: 4601

I've been having problems posting this ... if you've
seen it twice already, please accept my apologies!
!@#$%^&* Free Agent, someday I'll get my Falcon on-line!

For quite awhile now, Wizztronics
(http://www.wizztronics.com) has been asking
for comments and requests about what we would like
to see in their forthcoming TOS/GEM clone computer.

I've sent in a bunch of email suggestions, and recently
asked when the promised survey would be posted to their
web page. Part of the reply from Steve Cohen read:

>> After reading Email, almost daily I find many users
>> come up with brilliant suggestions. I'm sorry we do
>> not reply to each message sent, it would simply
>> take too much time away from developement.

I asked him if it would be okay to publish this comment
to the Usenet, and he said:

>Yes I have no objections to your request. We want
>users and prospective users to know what's going
>on. We do not want people to think we forgot
>about, or that we do not read their mail. All
>responses received from customers, and users of
>the TOS platform are important to us.

Now is the time to get that suggestion in writing and
emailed off to toscompinfo@wizztronics.com !! You
don't have to be a computer scientist to make a
suggestion, either -- if you've ever said to yourself
"I wish my computer would..." or "I wish I could do
this with my machine...", write it down and send it in!

On other computer platforms, you only get what they
have to offer. On our platform, you get a chance to
directly influence the features and capability of the
next update to the operating system & hardware.

Now's your chance!

I was playing around with the source code (Pure C) that was included
with my ScreenEye video digitizer and Lattice C. I didn't have much
luck working with it, mostly because I don't know what I am doing, and
also I think that some of the lib's required for the program to be
compiled are from the Pure C package. I had asked Remi Vanel (author of
Mountain) about this as Mountain works well on the NOVA as does
M_Player.
He gave me an assembly example below, but I am even worse at that:).
He is also very busy with studies, so I hate to bother him to much.

>Is there anyway to report the video mode to the ScreenEye software so
>it will display properly on the NOVA video card?

>Argg, *very* difficult if you don't have the source code.
>In the code, when a dot is drawn you juste have to replace :

>move.w (a0)+,(a1)+

>by:

> move.w (a0)+,d5
> ror.l #5,d5
> lsr #1,d5
> rol.l #5,d5
> ror #8,d5
> move.w d5,(a1)+

>where d5 is an unused register.

>As there is more instructions in the second methode, it will be too hard (for me)
>to patch directly the executable.

>Maybe you can ask the author... ?

(No! Software looks to be the author of at least some of the package.
Matrix the rest).

I have what I think is the complete source and other related files
needed to compile this under Pure C.

If anyone thinks they might be able to help out, it would be worth an
HBS T-36 for their ST/MST if I was able to get the software up and
running on my Falcon/NOVA setup.

Thanks,

Mike

Do you want a "module" player or a "midi" file player? If you
are after a midifile player which cam play sounds as well
there is only one and it's multitasking friendly. It works
very well under MagiC. This is called MIDPLAY and you can
find out more about it here:

http://perso.wanadoo.fr/softjee/

If you want a midi file player without sound you can find one
there as well, it's called PRETTY.

If you want a module player I don't know as I have got none
which works properly. There were one called MEGAPLAYER which was
pretty good and could play most formats, but it doesn't work
on my computer at all.

1445. Atari mouse port 3rd button query

Newsgroup: comp.sys.atari.programmer
Date: 1998-04-27 00:00:00 UTC
From: mb@tos.pl.net
Message-ID: <OZAXC6K@tos.pl.net>
Source record: 4607
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st,comp.sys.atari.programmer

I noticed after looking at the Atari mouse port pinout in my TT030 user's manual that on pin 5 there is room for a third (middle) mouse button.

While I don't know of any software that makes use of the third button, I wonder if the facility is there for a third button on pin 5, or is pin 5 simply not connected or ignored by the keyboard? If pin 5 is not ignored by the keyboard, does TOS support the third button? Is there any GEM software that uses the middle mouse button?

I ask as I am working on an adaptor to allow a serial mouse to be connected to the Atari ST mouse port. I would like to make the third button do something useful, but if pin 5 is disconnected or ignored it would not be sensible for me to use it. The other option is to make the third button act as a double click or as a simultanious left and right click, but I would not want to exclude users of perhaps X Windows or something that does make use of the third button on pin 5.

Another question - I observe that when the mouse is moved too quickly on my TT the mouse cursor moves in the reverse direction for a moment. I have noticed the same behaviour on other Atari ST series machines. (The effect is more noticable with third-party mice as they are faster than the Atari mouse.) I guessed that this must be caused by a movement count in the keyboard processor overflowing when the mouse is moved too quickly, and causing the sign to change. Is this really the reason? Is there anything I can do about that?

And finally, would there be any interest in such an adaptor? There is a serial mouse driver available allowing a serial mouse to be used on a serial port, but then you have the mouse port doing nothing while on the ST, with only one serial port, you have no serial ports left. Wouldn't it be better to be able to connect a serial mouse to the mouse port, leaving your serial port free for a modem? What do you think?

I look forward to your comments.

The TRAP dispatcher uses a fixed memory location to save
the registers and return adresses. The pointer to this
area is savptr (0x4A2). This says also nothing about
the routines changing their parameters on the stack.
I wouldn't count on those parameters staying unaltered.

Hans

I beleive that FaST Club sells a Mouse Tricks program that allows you to
use the third button on a mouse. all sorts of other tricks also.

> And finally, would there be any interest in such an adaptor? There is a

> be better to be able to connect a serial mouse to the mouse port, leaving
> your serial port free for a modem? What do you think?

bloody right it is a marvellous idea. Amiga mice are getting hard to
find,
Atari mice even harder. a thingy that would allow you to use a serial
mouse
on an ST mouse port is _such_ a good idea! I think I speak for all
owners
of the excellent Atari (sic) mouse that this would revolutionize usage.
I mean, if you can get a standard PC mouse hooked up, then wouldn't
other
possibilities such as track balls (maybe even tablets??) also work?
plus the added factor of not having to constantly unplug and plug in the
ST mouse connector might be an option as well, non?
YES!

IMHO Atari ST (at least) does not have hardware provisions for 3-button mouse.
This "extra" pin is simply empty.

Bonjour,

Dans l'article <3566833d.13867428@news.zetnet.co.uk>,
Tony Greenwood, <paxton@zetnet.co.uk> a ecrit :

>>IMHO Atari ST (at least) does not have hardware provisions for 3-button mouse.
>>This "extra" pin is simply empty.
>>
>>I believe the ATARI has 4 Mouse settings..well mine does...
>>
>>1=left mouse button
>>2=right mouse button
>>3=both mouse buttons
>>4=nothing (deep man!)
>>
>>Detecting third mouse button simply replaces option 3...I think!!

Not with standard functions... It seems that GEM/VDI functions
theoretically allow one button per bit of the returned word for the
mouse-buttons state.
That is, if 3 buttons :
%000 -> no button pressed
%001 -> button 1 pressed
%010 -> button 2 pressed (makes 2)
%011 -> button 1 & 2 pressed (makes 3)
%100 -> button 3 pressed (makes 4)
and so on...

The matter is that it seems that mouse-controller doesn't seem to be
made for using these capacities...
I had an optical 3-buttons mouse. As far as I could remember, pressing
the middle button had no effect on 520 but was recognized on Mega STE. But the
returned word was incorrectly set.
It was a long time ago, I can't give more details...

Hi!

I'd like to know if there's an implemnation of strcmp() and strcasecmp()
out there which respects foreign characters correctly, so that sorting via
those functions does "the right thing". I could do this for the German
"umlauts", but not for all the Scandinavian, French and Spanish national
characters. So, is there anybody who has done that?

Alternatively, could people from one of the above mentioned countries post
(or mail) a list of their national characters and how they get sorted in
the alphabet, with and without attention to upper/lower case?

Ciao

Thomas

P.S.: I need that for Thing, as some people have sent requests for correct
sorting ...

Hi there!

Mikael Folkesson (mikaelf@triton.tripnet.se) asked me to post this
message in the newsgroup:

Ruffly translated shortcuts (from German): (These ones are the real
standarised ones. Control-Space is no standardised shortcut!)

Standardised after decision of the developerconference (August '89):

Keyboard shortcut Function

Control-C copy
Control-F find
Control-O open
Control-Q quit
Control-V paste
Control-X cut

Shift-"arrow up" one page back
Shift-"arrow down" one page ahead
Shift-"arrow left" Cursor to beginning of line
Shift-"arrow right" Cursor to end of line

Control-"arrow left" cursor one word back
Control-"arrow right" cursor one word ahead

Home to beginning of document
Shift-Home (Clr) to end of document

Not standardised, but de facto-standard:

Keyboard shortcut Function

Control-A select all
Control-G search next
Control-M save as...
Control-N new document
Control-P print
Control-S save
Control-R replace
Control-U close top window
Control-W cycle to next window
Control-Y cut line to clipboard
Control-Z start shell

Alt-Control-Space iconify top window
Shift-Alt-Control-Space iconify application

NB: All 'Alternate-Control'-keyboard shortcuts are reserved for the system.

Wotcha fkruhm@one.net!

f> Organization: OneNet Communications News Hub
f>
f> is it possible? cause the compilers (in C) i have for the ST wont
f> work with WinSton... any ideas?

WinSton is not a very good emulator on the PC. Its really meant for running games, but doesn't even do this as well as PacifiST.

Have you tried TOSBOX? Thats probably the stablest emulator around, and its designed to run serious software.

Failing that, (and spending money) get MagicPC.

Cheers!

Hmm.... on the other hand I do have got a AB040 so my computer is
pretty fast. What is your problem? Atleast on my AB040 there are
no problems at all, but I guess a slow Falcon might have some
problems as it's quite a demanding program and I have heard that
under a multitasking system it can cause some keyboard troubles.
BTW. You realy should see MIDPLAY on a 040. The load is almost none
existant. It hardly show at all! If I turn off the caches the computer
hit the roof but with the caches enabled (which are bigger on the
040 than on the 030 as well) I get no slowdown what so ever. It's
marvelous what caches can do for you. :-)))

It seems that X11 can use the third button as I saw a friend using this
button on a falcon under Linux.

But he has a Mega-STE keyboard and not the original Falcon keyboard.
Perhaps these keyboards (and the TT-Keyboards) are quite different from
others.

Regards,

Benoit

Yes it'me, and effectively the third button work as a real third button with my MegaSTE keyboard whereas, before, it doesn't work with the original one. So i think TT & MSTE keyboard are able to recognise 3 buttons mouse. I will take time to look on TT keyboard datasheet this evening to confirm this information and eventualy i'll try to disassemble the 6301 code to check the existance of the third button routine.

1465. Atari Update Suggestions Due Soon

Newsgroup: comp.sys.atari.programmer
Date: 1998-04-29 00:00:00 UTC
From: strads@tmisnet.com
Message-ID: <35467f14.10518803@news.tmisnet.com>
Source record: 4627

(This was going to be a quick note ... sorry it
ran so long. Just excitable, I guess.)

> I'm still amazed that something like this
> hasn't been mentioned here before though...

Well, they're busy working on the new machine, and
I'm trying not to drool excitedly in public. Plus,
I'm not really associated with the project, so it's
hard to know just how much I should say.

I do know (via email) that the promised survey on the
Wizztronics page will be posted Sometime In May, which
is why I'm suggesting that the deadline for ideas and
suggestions is drawing near.

Since I consider myself a "recreational programmer"
(I know enough to get by, but not enough to create a
sale-able program), I'm doing two things:

1/ Sending in suggestions to make recreational
programming easier, both from a hardware
standpoint and from a GEM/AES standpoint
(since ease of use AND ease of programming
causes system growth and acceptance), and
2/ Advising the experts I come across that their
input is needed, right now!

The 680x0 architecture is already MUCH more efficient
than the x86 architecture, and GEM ... for those who
choose to use it ... is already MUCH more efficient
than MS-Windows; so concentrating on ease of use and
ease of program development is an important consideration
at this time!

Since Microsoft's[s&m] house-of-cards[tm] seems to be
nearing it's critical height, the availability of
another stable, reliable operating system (TOS) and
operating environment (GEM, MAGIC, et. al.) gives us
an edge we haven't had in years. There's a slight
chance we could overcome the dominant industry system,
in much the same way Microsoft overwhelmed the prior
dominant industry system (CP/M).

You may think your idea is "so obvious" that they can't
help but implement it, but my passing reference to an
"evnt_joypad()" call resulted in several postings and

an email or two that said "How come they haven't done
that yet?"

Just to be on the safe side, SUGGEST THE OBVIOUS!

In addition, Steve Cohen has stated for public consumption
that he receives email suggestions daily, and that many of
the ones he reads are "...brilliant!"

Just to be on the safe side, SUGGEST THE OBVIOUS!

Thanks for letting me ramble.

Hi!

It works indeed!

I have a TT keyboard on my Medusa and shortly bought an Alfa data 3-button mouse for Amiga. I had to switch 2 little jumpers and now it works...

Linux supports the middle button. Before that I had to set Emulate3Buttons in the XF86Config and press both buttons together without shifting the mouse. But that was messy.

If you have a 'normal' ST keyboard you can just connect the UP line of the Joysick 2 port also to pin 5 of the mouse port. That's it!

Hi!

Andreas Schwab <schwab@issan.informatik.uni-dortmund.de> wrote:
: Check out strcoll and strxfrm.

Well, that doesn't help me much for the MiNT-Lib:

/* dummy implementations for strcoll and strxfrm, that doesn't know about
* locales */

(That's a quote from strcoll.c ...)

So, my question remains: Has anybody an implementation of a local character aware str(case)cmp() for the Atari's charset?

And just an implementation of strcoll() or strxfrm() also won't be enough, because as far as I've understood them, they don't provide case insensitivity. I'd also need a locale aware implemenation of toupper() (or alternatively of tolower()), which the MiNT-Lib doesn't provide, either ...

Ciao

Thomas

P.S.: That refers to PL46 of the MiNT-Lib

Hey everyone,

I've got a poll set up where you can vote for the BEST Atari system.
Please stop by and place your vote! Right now the Lynx is in the lead
with the 2600 is 2nd place and the Jaguar in 3rd. Of course, I'd really
like to see the ST and 8-bit have a presence too...

Here's the votin' place:

what?
It seems to me that it is _during_ the survey that one makes
suggestions. Unless this survey is a compilation of info,
rather than requesting info? The Wizz page seems to suggest to me
that the survey form will be posted and one can input then, non?

IIRC, the reason they added the toscompinfo@wizztronics.com
email address was to handle the suggestions they were receiving.

> Unless this survey is a compilation of info,
>rather than requesting info? The Wizz page seems to suggest to me
>that the survey form will be posted and one can input then, non?

Yes, the Wizz page /does/ make that implication. If it
wasn't for the fact that I'd received an email from
Wizztronics noting the receipt of many good ideas
from a variety of Atarians daily and stressing the fact
they can't reply to every suggestion received, I'd be
inclined to wait, too.

I'm looking forward to the survey, sensing it will be
a "which do you prefer, this or that" type of document
(just guessing, here).

-- George Crissman
-- strads@tmisnet.com

Wouldn't it be nice to have a form_progress(), an
easy-to-use standardized progress bar similar in
concept to form_alert? It could be non-modal so
that several could be active at the same time. This
would be perfect for multitasking environments or
multiple-simultaneous-file-downloads when using PPP.

1471. Middle mouse button, how reported?

Newsgroup: comp.sys.atari.programmer
Date: 1998-05-02 00:00:00 UTC
From: mb@tos.pl.net
Message-ID: <7CGXCEZ@tos.pl.net>
Source record: 4633
Cross-posted to: comp.sys.atari.programmer,comp.sys.atari.st.tech

How is the middle mouse button state reported by the keyboard processor?
According to the compendium a relative mouse packet header byte reads as
follows:

0xF8 - No buttons pressed
0xF9 - Left button pressed
0xFA - Right button pressed
0xFB - Both buttons pressed

How is the middle button reported?

And can anyone tell me on which machines the middle button works and on
which it doesn't? I think someone mentioned before that it works on the
Mega STE but not the ST. What about the TT, Falcon, STacy, Mega ST or any
other machines? What about the new Atari clones, do they even have an
Atari mouse port?

Thank you for your assistance.

I know very little (if not nothing!) about this, but I would think that you ought to be investigating 'wide' character sets to see if they have a portable scheme for this problem.

>out there which respects foreign characters correctly, so that sorting via
>those functions does "the right thing". I could do this for the German
>"umlauts", but not for all the Scandinavian, French and Spanish national
>characters.

Is this simply because you don't know which are upper/lowercase ir because the order they appear in different fonts changes (or both)?

>So, is there anybody who has done that?

Certainly not me! :-(

Gem is theoretically capable of dealing with lots of buttons.

>something that does make use of the third button on pin 5.

iirc, 8 bits are used so 8 buttons could be used. In reality though,
this would be unrealistic as only 7 buttons could be used because of
software constraints. Having said that, for the same reasons, I
wouldn't expect software to "see" more than two buttons.

>Another question - I observe that when the mouse is moved too quickly on
>my TT the mouse cursor moves in the reverse direction for a moment. I have

>can do about that?

The keyboard processor reports mouse movement as keyboard "make" and
"break" actions. If it reports it faster than the serial line or
interrupt service routine can cope with then things are going to go
"pear shaped".

>And finally, would there be any interest in such an adaptor? There is a

It would indeed be better to have it conected to the normal mouse
port, certainly for folks who are "online".

> Much nicer than:

```
> FOR i&=1 to LEN(the.string$)
> MID$(the.string$,i&,1)=CHR$(PEEK(table%+ASC(MID$(the.string$,i&,1))))
> NEXT i&
```

(I can't tell which version of BASIC you are using, so some of these suggestions may not yield any improvement in code size or speed)

First optimisation: calculate the string length _before_ entering the loop. Depending on how good your BASIC is, it may already do this. But, it doesn't have to. So, the code becomes:

```
length = len( the.string$ )
For i = 1 to length
do stuff
Next i
```

Second optimisation: You've calculated the same address twice as part of two MID$ statements. Calculate it once, and use the calculated result later.

```
address = adr( mid$( the.string$, i, 1 ) )
bytepoke address, bytepeek( adr( table + bytepeek( address ) ) )
```

Third optimisation: move the address calculation out of the loop - you only need to find the start of the.string$, and you'll be stepping through it byte by byte, so there is no need to recalculate the address on every iteration.

So, it becomes:

```
address = adr( the.string )
length = len( the.string )
for i = 1 to length
address = address + 1
bytepoke address, bytepeek( adr( table + bytepeek( address ) ) )
next i
```

I haven't coded seriously in basic in about a decade, so these suggestions on code optimisations may not be worth the effort of changing your code.

... but I think it is highly likely that they are worth changing, as (IMO) it
is unlikely that it is automatically making these optimisations.

1476. disk read during interrupt

Newsgroup: comp.sys.atari.programmer
Date: 1998-05-03 00:00:00 UTC
From: arjanbok@pop.xs4all.nl
Message-ID: <6iiimk$s16$1@news2.xs4all.nl>
Source record: 4638

Is there a way to read/write data from/to a harddisk
during an end of sound buffer interrupt routine?
(on a FALCON)

I tried several functions: rwabs, dmaread and Fread,
but the all freeze the system so that even a ctrl+alt+del
does not work.
This is probably because these are BIOS, XBIOS AND GEMDOS functions.

Does anyone know of a way that does work, or is what
I want imposible?

It's GFA Basic. I found it more 'comfortable' than Hisoft Basic. Not that
Hisoft was that 'uncomfortable', but with GFA, it's easier to see where
something mucks up.

That's basically how the final function looks. The bit I wrote was a (bad)
example of how it worked. The snippet above is how the assembler version
looks, more or less.

Hi,
I've got an Atari 1040 STF with an SC1224 atari RGB monitor and an
external 20 MB Supra hard drive.
$120 buys it all.
Everything works, and is in very good condition.
And yes, I have the mouse.
Also, the monitor has built-in speakers.

You also get 3 years worth of disks from START magazine, a few games, and
Mark Williams C compiler with manual.

Please mail me if interested.

What about something like:

```
#define GFX_MODULE 0x01;
#define DTP_MODULE 0x02;
#define TXT_MODULE 0x04;
#define.....

void main()
{
while(do_program(GFX_MODULE|DTP_MODULE|TXT_MODULE));
}
```

Which will give you a program with those modules? Cool eh?

:-)

Port de GNU C library to Pure C. I might have
it lying around somewhere. Will have a look for
you if you are intrested (I also have the complete
string lib).

1484. help playing 44k1 audio samples on a falcon

Newsgroup: comp.sys.atari.programmer
Date: 1998-05-04 00:00:00 UTC
From: Vincent Bakker <bakkerv@pi.net>
Message-ID: <354E2E01.217B@pi.net>
Source record: 4643

Can anyone help me with a piece of C code that can do DMA play on 44k1?

I can get DMA play to work on falcon sample rates, so I know how to get DMA play to work, but not with an external (44k1) clock signal and it's really the external clock part I'm looking for (my guess it's about one line of code...)

Purpose is a fast'n'simple player to scan samples (avr, wav and aif) on cd-roms without having to start (and close!) an application.

btw I tried several pieces of source that claim to use the external clock I found on the internet but none produces any audible results.

> wouldn't expect software to "see" more than two buttons.

Is it really a question of the software seeing the physical buttons?
I would have thought it would be possible through the OS to have a
button
press assigned to whatever event you want? i.e. clicking the third
button
send a signal to the closer of the window the cursor happens to be
topping then.
or the third button could be assigned to any system event you chose,
non?
loading a mouse driver would allow all sorts of setups, as all mouse
actions
would be interpreted by the driver and the way it was configured.
am I way off base here?

1486. ST+ Fanzine STOS CORNER + New STOS Manual

Newsgroup: comp.sys.atari.programmer
Date: 1998-05-04 00:00:00 UTC
From: Deano@zetnet.co.uk
Message-ID: <3551b907.1045417@news.zetnet.co.uk>
Source record: 4645

Theres one thing I think about every time I create the STOS Corner for the Fanzine, that is...how many people actually read and enjoy it.

The next issue sees the start of a game creating tutorial and I wondered, with it being such hard work to create such a tutorial, would it be worth it.

Therefore, I would apperciate it if you could post your comments either to this list or direct to me at Deano@zetnet.co.uk

So basically I am asking.....should I keep the STOS Corner or should I drop it? After all, if noone reads it its a waste of time.

Also, if I wrote a manual like the Games Maker Manual by Stephen Hill which showed in detail how to write various programs like games, databases, art packages etc and sold it at a reasonable price would anyone be interested. If so, please send me an email with New STOS Manual as the subject, and if enough people show interest in purchasing such a manual then I will write it.

: > lsr #1,d5
: > rol.l #5,d5
: > ror #8,d5
: > move.w d5,(a1)+

: >where d5 is an unused register.

Hmm, shouldn't the ror.l and rol.l be ror.w and rol.w?
Anyway, if this is supposed to do what I think it's supposed to do,
it just converts a pixel with Falcon bit-ordering to a little-endian
(intel-style) 15-bit pixel:

Falcon bit-order: rrrrrgggggxbbbbb
(where x is either an overlay/genlock bit or an extra green bit)

NOVA bit-order: bbxrrrrrgggggbbb (where x is an overlay/genlock bit)

In C this would be:

dest = (src >> 9) | ((src & 0xff00) << 5) | ((src & 0x1f) << 9);

This would be _much_ slower than the assembly code, though...

: I have what I think is the complete source and other related files
: needed to compile this under Pure C.

Is the source commented? If so, you'd just have to look up the plot or
line-conversion routines (whatever it uses) and modify them for the NOVA
pixel format. (Does the NOVA have a 16-bit mode? If so, you could simply
swap the bytes in the output pixels)

: If anyone thinks they might be able to help out, it would be worth an
: HBS T-36 for their ST/MST

What's that then? :)

You *need* an external clock : it's a small electronic device you plug on
the dsp expansion port.

> What Am I doing wrong?

Well one think comes to mind. event_multi() may return multiple events
at once so you should check for every event everytime not just one.
e.g.

event = event_multi(...);

if (event & MU_TIMER) { ... }
if (event & MU_MESAG) { ... }
if (event & MU_KEYBD) { ... }
etc...

and not like this:

if (event & MU_TIMER) { ...}
else if (event & MU_MESAG) { ... }
else if (event & MU_KEYBD) { ... }
etc...

other than that I don't know...
```

>What Am I doing wrong?

Maybe you don't test all the possible return messages individually? The evnt_multi() function returns a bit array stating which conditions that were fulfilled, so a timer event may occur at the same time as your program receives a message.

1493. MagiC's VT52 crashing

Newsgroup: comp.sys.atari.programmer
Date: 1998-05-05 00:00:00 UTC
From: gary@the-gap.demon.co.uk
Message-ID: <29376423_000003_OASIS_NEWS@the-gap.demon.co.uk>
Source record: 4506
Cross-posted to: comp.sys.atari.programmer,comp.sys.atari.st

I'm having problems with a .TTP program that I've written when it runs in MagiC's VT52 window. Every so often it crashes and the VT52 program then hangs and has to be killed.

This seems to be related to the length of lines being output, but I'm not sure.

All my program does is a Cconws of a string, and I suspect the problem is actually not my program, but VT52.

Does anyone know if this is a known bug in the VT52 program, or could it be something I'm doing? If it's a bug, does anyone know if there is a more reliable replacement for VT52 under MagiC?

Thanks for any help,
Gary

Message-ID: <6ins0e$b9u$3@heliodor.xara.net>
Source record: 4507

For those of you who have not seen the best disczine around Click on the links below and get disc 1 and 2 or issue 2 of MEGA DISCZINE.

If you have seen MEGA why have you not supported this new zine. There are lots of you out there who must of liked something in it. But you don't tell us what you liked and what you didn't.

It only takes a moment to return the questionnaire, or to offer some ideas of your own. We need your support NOW. The more support we get the faster MEGA will be produced.

The MEGA member list is getting slowly longer but we need more feedback, We need to know that people are reading it and liking it, There would be little point in producing a zine if there is now one reading it. This would be a great shame as there is now other zine like it.

So come on, Lets have some feedback, I want to make it YOUR zine, Let us know what your would like to see happen and the MEGA team will support your idea.

Why not send in something in, Ramble on about anything you like, We want to hear from you. Get your name added to the credits list at the same time.

I have mailed MEGA 1 and 2 to god knows how many people over the last month, Well, Ok, It has not appeared on my site yet, But you can get it now if you wish. Simply join the mailing list and you will get MEGA before it goes onto my site. Out of all those people how now have got it, only a handful have had any comments. This is good but we need more now !

Issue 3 WILL appear but how soon all depends on you. So get writing and send something in, or at least tell us what you though about MEGA. It only takes a moment so why not go for it, your not going to loose anything by sending a mail to me.

If you have seen UFOST by Lee Round then please support his UFO zine with you UFO related material. Lee is now in 2 minds weather or not to do issue 3 because of all of you how seam to be scared or writing a letter to him.

I have issue 2 ready for E-mail should you dare to ask for it. Sorry but it has not yet been added to my site, Keep trying though !!

Here are the URL's for issue 2.

Thanks guys. I found the prob. Actually someone here gave me the clue
:)

Was just the way I was checking for the messages, It worked, but not
consistent, Now I use if event and mu_button for example, with all the
rest, and everything if caught properly :)
so thanks again.

(about the event_multi() and evnt_multi() yes, of course, well, As I
said, it worked, but not consistent if I added the | mu_timer, so if
my mistake was that big, I think it wouldn't have worked at all :)

Nope. There are lots of stages involved though and if any one of them
is deficient in some way then it may not work.

Firstly the keyboard processor must (a) posess hardware to detect the third button, (b) posess the software to process such a third button.

Secondly the keyboard processor passes this information as keypress codes. One is sent each time the mouse "changes" and they are caught by a general interrupt routine which then dispatches incoming data to the relevent drivers - keyboard, joystick, mouse etc. Thus the general routine must be capable of detecting and dispatching these 'new' mouse codes to the mouse driver and the mouse driver must be able to preserve them.

The third stage is the VDI mouse handler. It must be capable of handling the new codes and translating them according to the requirements of the AES which finally will make them visible via such system calls as evnt_multi etc.

In turn the applications being run will need to be able to process them. Alternatively, as you suggest, if the third button is to be used to generate existing messages instead, then at some point between the VDI mouse handler and the AES, a message (such as WM_CLOSED) must be injected into Gem. This would require the "injector" to have access to both the active window handle, and the relevent application's message pipe - which may be impossible as these internals will not be known.

On the other hand, a suitable (say) accessory could make use of a 3 button evnt_multi upon which it could send a WM_CLOSED with the desktop id to the window under the mouse, which would fool most applications. This isn't a clean method however and can lead to problems.

I'm not saying >2 buttons is impossible - just that there are a lot of things which can get in the way! ;-)

That's a bit too specific, a 'form_print' could serve the same purpose. If you think about it, even if form_progress only dealt with single lines you would still have to have the ability to "word wrap" just in case the text string was too wide for a particular resolution. This in turn requires the generation of an object tree on the fly so that the required amount of G_STRING or G_TEXT objects could be generated - then you have to create and open a window of the correct size. Having gone to this much trouble you might as well add in the ability to process simple control codes such as CR, LF, CLS, HOME and (maybe) TAB. ;-)

I know that's not the current question, but I rewired a pc mouse to an atari mouse (trackball, in fact), and there was 3 buttons. Originally the 3rd button was used as a 'first button on/off'. It was managed by the microcontroller of the mouse. Some pc mouse use the 3rd button as 'first-double click'.
I choosed a new way : my third button is the "return" and I find it usefull for default (gem)buttons.
What I'm trying to say is : If a pc mouse is connected to a falcon's serial port (serial, lan, midi), the soft has to redirect the mouse messages as if it is form the original keyboard. This soft could propose several options to use the 3rd button.
Just an idea ...

Eric

Well, sure, you could have a special-purpose progress bar alert box for printing operations, but a general-purpose form_progress() box would also work for printing functions just fine.

In addition, form_progress() would also lend itself to file downloading operations, user-decision/timeout activity, file format translations, and other hey-I'm-working-on-it / wait-until-I'm-finished situations.

>If you think about it, even if form_progress only
>dealt with single lines you would still have to have
>the ability to "word wrap" just in case the text
>string was too wide for a particular resolution.

Display text used in form_alert() is limited to a maximum of 30 characters per line, IIRC, making word-wrapping unnecessary. Using the same prompting mechanism in form_progress() (with an added progress bar, of course) would work in all resolutions, all the way back to ST low for those who enjoy looking at large, readable characters.

As a bonus, using the same construction from a programming standpoint would lessen the confusion (and potentially reduce space demands on the RSC file) that occurs when two similar calls implement identical functions in different ways.

>This in turn requires the generation of an object
>tree on the fly so that the required amount of
>G_STRING or G_TEXT objects could be generated -
>then you have to create and open a window of the

It would be no different from the existing form_alert() which can display an icon (if desired), 1 to 5 lines

of programmer-supplied text, and 1 to 3 exit buttons
(one of which may be defined as the default exit by
the programmer).

It's not necessary to open a window to display a
form_alert(), IIRC, and I don't envision opening a
window to display a form_progress() although a
window-like handle might be needed to handle updates
to the progress bar (i.e., 100, 237, 862, all the way
up to 1000) since the form is supposed to be non-modal
in nature.

Does form_alert() really generate an object tree
on the fly?

>Having gone to this much trouble you might as well

Hello,
I need YOUR help.
I've been using my ST to make music for years. Now, having been inspired by Electronic Cow and others, I want to learn a bit of programming.
Unfortunately I know NOTHING.
Are there any essential bits of reading to do? On-line, or are there books?
Should I be learning C, or some kind of Visual Basic?
What about compilers?
Where, in other words, do I start?
I'd really appreciate any help you can give me.
Please mail me at screenstyles@hotmail.com.
Thanks,
Paul.

1512. ---> Support MEGA 3 <---

Newsgroup: comp.sys.atari.programmer
Date: 1998-05-07 00:00:00 UTC
From: Chris Swinson - MEGA Disczine <mega01@globalnet.co.uk>
Message-ID: <6it4im$26d$3@heliodor.xara.net>
Source record: 4525

For those of you who have not seen the best disczine around Click on the links at the end of this message and get disc 1 and 2 of issue 2 of MEGA DISCZINE.

If you have seen MEGA why have you not supported this new zine. There are lots of you out there who must of liked something in it. But you don't tell us what you liked and what you didn't. There are a lot of people who have not yet seen MEGA so get downloading there or over 200 articles on the 2 discs with a nice shall which anyone can use without any info at all on it.

There are many sections in this zine, Some or 1 off and are very interesting to read, It would be impossible to list them all so heres a quick rundown.

True horror/ghost tales, STOS, Tesla, Electronics, jokes and humour, Dreams what they mean and stuff, get rich, UFO articles, stories, Anti car crime, Reviews, Returned questionnaires, Science, Black holes, and much more. Simply take a look and you will be amazed on what we have found for you. There should be something for everyone in issue 2. Lets here what YOU would like to see appear !!

It only takes a moment to return the questionnaire, or to offer some ideas of your own. We need your support NOW. The more support we get the faster MEGA will be produced. Anything you do will be included in issue 3 which is currently been done by the MEGA team.

I want to make MEGA "YOUR" zine, so tell me what you want and we will include that page in the next issue. Any ideas not matter who obscure or small they be, are more than welcome.

The MEGA member list is getting slowly longer but we need more feedback, We need to know that people are reading it and liking it, There would be little point in producing a zine if there is now one reading it. This would be a great shame as there is now other zine like it.

Why not send in something in, Ramble on about anything you like, We want to hear from you. Get your name added to the credits list at the same time.

I have mailed MEGA 1 and 2 to god knows how many people over the last month, Well, Ok, It has not appeared on my site yet, But you can get it now if you wish. Simply join the mailing list and you will get MEGA before it goes onto my site. Out of all those people how now have got it, only a handful have had any comments. This is good but we need more now !

Everyone who has sent me mail over the last few weeks has not been added to the list. If you would like to be added to the mailing list then please re-mail me so I can add you to the list. Please check if you have requested to be added to make sure you have been added.

Issue 3 WILL appear but how soon all depends on you. So get writing and send something in, or at least tell us what you though about MEGA. It only takes a moment so why not go for it, your not going to loose anything by sending a mail to me.

If you have seen UFOST by Lee Round then please support his UFO zine with you UFO related material. Lee is now in 2 minds weather or not to do issue 3 because of all of you how seam to be scared or writing a letter to him. If you would like to send Lee mail, Send it to me but put "FOR LEE ROUND" in the subject box and I will be happy to pass it onto him. If your interested in UFO's or related stuff then request issue 2 of UFOST now, I regret it still has not been added to my site. Send me a mail if you would like a copy.

I have issue 2 ready for E-mail should you dare to ask for it. Sorry but it has not yet been added to my site, Keep trying though !!

Here are the URL's for MEGA Disczine issue 2.

ftp://ftp.funet.fi/pub/atari/mag/mega/mega2_d1.zip

ftp://ftp.funet.fi/pub/atari/mag/mega/mega2_d2.zip

Hmm, up to now I've only seen proposals that move frequently used stuff into the OS. Although that certainly is desirable, it is not an important matter. I consider suggestions far more important that *ENABLE* new functionality that was not achievable up to now. An example what I'd really appreciate is a evnt_multi() extension that allows linking code that checks for additional events, similar to what MiNT does with it's select() call for files. Right now, an application needing to wait for some event needs to do so via polling and employing MU_TIMER, which is not efficient and blocks the system if several applications use this. This effect is not even achievable by linking own code before the AES's evnt_multi() call, but requires changes deep in the AES.

> How is the middle button reported?

The keyboard processor knows only two buttons, i.e. two inputs. The button
you hook to the one is treated as the left, the button at the other input
is treated as the right button. No more buttons are supported.

You can connect a serial mouse to a serial port, but I do not know the
details how buttons are reported.

> And can anyone tell me on which machines the middle button works and on

AFAIK they all use the same keyboard processor.

> What about the new Atari clones, do they even have an
> Atari mouse port?

Probably not if they employ PC keyboards.

>
> Does anyone know of a way that does work, or is what
> I want imposible?

This is a tricky thing to do as neither GEMDOS nor BIOS nor XBIOS are
reentrant. With MagiC, they are, so you can call, say, GEMDOS from
interrupt; but this will work with no other system (not even MiNT !).

What you can do is link into the traps #1, #13 and #14 to set and reset
a flag indicating that a GEMDOS etc. call is being executed. Then, have
the end-of-buffer interrupt enable some code that is periodically executed,
say, from the 200 Hz interrupt. This code checks the flags mentioned above
and jumps to the floppy access code if neither is set, or does nothing
otherwise, until that periodical interrupt fires again.

You'll need to be very careful to make this code portable such that it
will work will all systems.

> Any idea why the aes gem message get messed up and not reliable?
> What Am I doing wrong?

You might have fallen into a well frequented pitfall ;-)

evnt_multi() does return more than one event on occasion. So

```
event = evnt_multi (MU_TIMER | MU_MESAG, ...);

if (event == MU_TIMER) { ... }
if (event == MU_MESAG) { ... }
```

is broken code and can produce precisely the effect you describe.
Use

```
event = evnt_multi (MU_TIMER | MU_MESAG, ...);

if (event & MU_TIMER) { ... }
if (event & MU_MESAG) { ... }
```

instead.

ROTFL ! ;-)

AFAIK event_multi() is provided by some GEM libraries. Talking about the
AES, true, only evnt_multi() exists.

what is the best way of knowing how much TTram you have, not what's
left, but what's installed.
so far I am using a pointer to $5a4 then - 16meg, but it seems not
reliable on every case, example some TT with some g.card, not all
though!. very weird.
any idea?

FWIW, there is already such an adapter for the Amiga, called
"Topolino" or similar. Since the only difference between Amiga and
Atari mice are the pinouts (which is why most aftermarket mice are
switchable between the two), anyone needed such a solution tomorrow
could purchase a Topolino and wire up and adapter.

BTW, if you incorporate a switch into your device, you could market it
to both Atari and Amiga owners, something the makers of the Topolino
overlooked.

On the subject of third button support, it would be nice if support
for the "fourth button" some mice now have (usually on the side, like
the current top of the line Logitech mouse, and the newest version of
the inexpensive Genius Netmouse), as well as scroll wheels. About the
only way I could see to support that, however, would be to make use of
the second joystick port for the signals (and either a custom driver
or software written to spec would be required, of course).

Topolino is a nice device, but at $40 it costs twice as much as an
Atari mouse!

1523. Atari C compiler

From: centek <centek@graphity.fr>
Message-ID: <6ivqqt$j2t$1@news.imaginet.fr>
Source record: 4536

I am looking for informations about the way Atri C compilers store their debugging informations in executable files.

This is important because I want CENTinel (our 68030/040/060 & 56001/56301 Debugger) to provide Source Level Debugging.

Any informations about Pure C, Lattice C & GCC would REALLY help a lot !!!

Source record: 4538

Hello everyone,

I'm currently writing a game in STOS BASIC. I've made a title
screen and have letters i.e sprites fall down the title screen into their
positons. The problem I'm having is when the letters fall their
backgroung color overwrites where the have fallen to. I only want the
characters to be displayed and not the backround color on which they were
displayed. Any ideas?

I've no idea. I've been using v2 for about 2 years, and used v1.? for a
few years before that. I haven't seen much in the way of updates, but then
again, I haven't really been on the lookout for them.

> Back in the old days it took about the same amount of time to avoid Sozobon
> C's internal bugs that it took to troubleshoot your own ones ;)

Would you care to tell me what these bugs are/were, as I've not noticed any.
And as the programs I write in C are compiled with Sozobon, I'd like to know
if there are likely to be any problems.

One good thing about Sozobon is the source for the libraries are available,
if you're using dlibs, so any real problems can be sorted out by rewriting
and recompiling the relavent functions. I did that to add desk accessory
support directly into the init code, with a variable to check the PRG/ACC
status, as well as adding support for atexit().

Message-ID: <Esp3Lx.FFv@uia.ua.ac.be>
Source record: 4543

Twinkle900 (twinkle900@aol.com) wrote:

```
: struct part_record
: {
: int part_num;
: int price;
: int quantity;
: }
: i know how to do basic maniputlations of binary trees, like transversing trees
: and all, but i am not sure of how to store a struct in a binary tree.
```

In fact, binary trees are rather easy. You should smth like :

```
typedef struct {
int partnumber;
int price;
int quantity;
} PartInfo;
```

and then :

```
typedef struct Node {
PartInfo data;
struct Node *left;
struct Node *right;
} PartNode;
```

Then, you can access your fields through :

```
{
PartNode *p;

/* ...SOME CODE... */

p->data.quantity = 100;

/* ...SOME CODE... */
}
```

Now remains the question how your Binary tree will be ordered. Does it have
to be sorted by price, quantity or partnumber ? There's no use in this case
to use a binary tree if it isn't for searching (hence, a Binary Search Tree).

If you have any further questions, just ask.

Good luck !

1531. ---> MEGA 3, Support needed NOW ! <---

Newsgroup: comp.sys.atari.programmer
Date: 1998-05-09 00:00:00 UTC
From: Chris Swinson - MEGA Disczine <mega01@globalnet.co.uk>
Message-ID: <6j2i8m$2d5$3@heliodor.xara.net>
Source record: 4544

MEGA 2 is now added to my site, Still working on the other links so please bare with me. Or you can get MEGA 2 by clicking on the links near the end of the message.

If you have seen MEGA why have you not supported this new zine. There are lots of you out there who must of liked something in it. But you don't tell us what you liked and what you didn't. There are a lot of people who have not yet seen MEGA so get downloading there or over 200 articles on the 2 discs with a nice shall which anyone can use without any info at all on it.

There are many sections in this zine, Some or 1 off and are very interesting to read, It would be impossible to list them all so heres a quick rundown. True horror/ghost tales, STOS, Tesla, Electronics, jokes and humour, Dreams what they mean and stuff, get rich, UFO articles, stories, Anti car crime, Reviews, Returned questionnaires, Science, Black holes, and much more. Simply take a look and you will be amazed on what we have found for you. There should be something for everyone in issue 2. Lets here what YOU would like to see appear !!

It only takes a moment to return the questionnaire, or to offer some ideas of your own. We need your support NOW. The more support we get the faster MEGA will be produced. Anything you do will be included in issue 3 which is currently been done by the MEGA team.

I want to make MEGA "YOUR" zine, so tell me what you want and we will include that page in the next issue. Any ideas not matter who obscure or small they be, are more than welcome.

Can you suggest a good articles site, Something you may think could be of interest to other MEGA readers ? No matter what it is we would like to here from you. Just look at the area of topics we are covering, You name it, we will do it. Anything you may think could possibly help please mail me the links, If I use the site I will give you credit (of course) for giving me the site URL.

The MEGA member list is getting slowly longer but we need more feedback, We need to know that people are reading it and liking it, There would be little point in producing a zine if there is now one reading it. This would be a great shame as there is now other zine like it.

Why not send in something in, Ramble on about anything you like, We want to hear from you. Get your name added to the credits list at the same time. Get on the MEGA mailing list, or ask if you are already on it just to make sure (I may have missed you off for some silly reason).

I have mailed MEGA 1 and 2 to god knows how many people over the last month, Well, Ok, It has not appeared on my site yet, But you can get it now if you

wish. Simply join the mailing list and you will get MEGA before it goes onto my site. Out of all those people how now have got it, only a handful have had any comments. This is good but we need more now !

Everyone who has sent me mail over the last few weeks has not been added to the list. If you would like to be added to the mailing list then please re-mail me so I can add you to the list. Please check if you have requested to be added to make sure you have been added.

Issue 3 WILL appear but how soon all depends on you. So get writing and send something in, or at least tell us what you though about MEGA. It only takes a moment so why not go for it, your not going to loose anything by sending a mail to me.

Issue 3 is really taking off now, We need your suppot now ! We have had good responce for MEGA but no one knows how they can help, First of all fill in the questionnaire. I will try to suggest a article that you can write about, you then simply write it and have the sortcut to fame in issue 3.

If you have seen UFOST by Lee Round then please support his UFO zine with you UFO related material. Lee is now in 2 minds weather or not to do issue 3 because of all of you how seam to be scared or writing a letter to him. If you would like to send Lee mail, Send it to me but put "FOR LEE ROUND" in the subject box and I will be happy to pass it onto him. If your interested in UFO's or related stuff then request issue 2 of UFOST now, I regret it still has not been added to my site. Send me a mail if you would like a copy.

I have issue 2 ready for E-mail should you dare to ask for it. Sorry but it has not yet been added to my site, Keep trying though !!

Here are the URL's for MEGA Disczine issue 2.

ftp://ftp.funet.fi/pub/atari/mag/mega/mega2_d1.zip

Sounds like you don't have the SCSI cable terminated properly. Only the last device should be terminated, either on the device itself or you can place a SCSI Terminator at the end of the cable.

OR

Both devices have the same SCSI ID. Make sure each device has a unique SCSI ID and don't use 7, it is reserved for the SCSI Controller.

Source record: 4449

Hmmmm ... this is hard to answer gently and
effectively. Using a well-written program is
easy, writing a well-written program can be
very difficult.

You need to be aware of:
a) standard implementation techniques
(does File, New open a window or clear
the existing one?)
b) expectations of the program user
("it doesn't do what I mean!")
c) bugs in various versions of the operating
system and how to squash them.
d) "features" in OS calls that don't work the
way they're described, but in a manner that
makes sense ... kinda.
e) how the programming language works.

My recommendation -- get a copy of HiSoft Basic
for your computer, then hit the used book stores
for an "Introduction to Microsoft Quick Basic"
book (You'll find the two are AMAZINGLY similar...).

Read the book, do the exercises, and get comfortable
with the language even though you won't be doing much
windowing to start.

When you reach the point where you can comfortably
define a project and program it to completion, you're
ready for GEM. And with one of the "From Basic to C"
books, you'll be able to use Lattice C (not one of the
friendliest compilers out there, BTW).

It's been said that a programmer new to the windowing
environment takes a year to become productive. With a
bit of dedication, and the experience that comes through
time, you'll be able to experience the joys and
frustrations of programming on your own computer.

Just don't get discouraged -- take the successes as they
occur, and you'll do just fine. Besides, we're all friendly
in here and glad to help out.

Does this answer the question?

I see by the huge response to this message that there is either:

A. No modem software that was ever written.
B. It was written, but no one thinks it's important enough to say.
C. All Falcon owners who use newsgroups already have modems and just don't
care anyway.

Hello all,
My name is Sam and I'm the one who sent out the CDRom Problems message a few days ago. Thanks to everyone who responded with ideas and suggestions. Unfortunately, I haven't been able to try any of the suggestions because my Falcon won't even boot now! :(When I turn on my Falcon, you can here the power supply kick on and the hard drive starts to boot, then it stops. When I disconnect the hard drive and attempt to boot from floppy, the only thing that comes on is the power supply. Can anyone tell me what to do so that I can at least get my Falcon to boot?
Getting desparate,
Sam

There was a software-modem under developement, supposed to run at about
14.4Kbps, but due to someone's stupidity, most likely Atari Corp. going
Jaguar and not really caring about anything else, it got forgotten. The
product was one of many reasons to buy a Falcon in the first place. I
beleive I once also heard that the developers wanted too much money for the
product, and that was one reason for why it never got to the market.

>And as the programs I write in C are compiled with Sozobon, I'd like to
know
>if there are likely to be any problems.

I wrote K&R ANSI-C code only as I was taking classes in C/C++ and was supposed to use Borland's C++ which was a bit truoblesome when I had no IBM PC clone. I had a lot of problems that I can't remember, but I remember that you could get rid of some errors by moving your code some lines up or down, without really changing anything. Since there is a new version I beleive many of the v.1 bugs have been fixed, and it should be safe to use it now. I've already downloaded v.2 and will try it out as soon as I get time to, let's say in a couple of years ;)
I remember all those hours with the lousy photocopied papers from the class, K&R's book on the C language, coffee (and more coffee) and my Mega 2ST hooked up in a clauset ... accessing drives an generating millions of errors on the dusty little screen. Today I barely have time to use my Falcon, and I've got so much problems with HD casings, drivers, OS's and so forth ... there is no longer time to do anything productive and creative with your Atari ... you need to upgrade ;)

BTW, do you know if Sozobon C runs under MagiC? ... Then I would definately run Sozo!

You need to do a transparent blit. Don't ask me how, I don't use STOS.
Should probably be in the user manual somewhere. Look up "transparent" in
the index.

Exactly!
People also seem to forget that these things actually won't make programming
for Atari machines in general any easier. You still have to provide code
for all non-Wizztronics machines...

When it comes to hardware, I gave up on Wizztronics years ago (anyone else
remember the Barracuda and more recently the Hawk?), and we certainly don't
need (IMHO) any further OS compatibility problems.

'Ease of use' things belong in libraries, preferably shared ones.

>matter. I consider suggestions far more important that *ENABLE* new
>functionality that was not achievable up to now. An example what I'd
>really appreciate is a evnt_multi() extension that allows linking code
>that checks for additional events, similar to what MiNT does with it's

I agree that things like that would be useful, but only if they are
available in all OSes, or at least in a free one, like OAESis or XaAES
(or MiNT, fVDI etc depending on the OS level in question).

>This effect is not even achievable by linking own code before the AES's
>evnt_multi() call, but requires changes deep in the AES.

You should be able to get the same effect by using a multithreaded
application. Just let one small thread do the evnt_multi() and then send
the messages along to the main code via a pipe (which can then be used in a
select()) when they occur.
Not as nice as real AES-level support of course (and there will be some
performance penalty (probably not very much)), but I think it would work.

Probably both A and C. I haven't heard of any such software, and from
what I heard in the early days, it wouldn't be possible to practically
make a modem that was fast enough to compete with serial modems. It
would still take hardware to do it, and there's probably no business
in it, since modems are so cheap nowadays anyhow.

This is what I've heard, and my oppinions. If anyone knows better than
me, please tell. :)

The answer is yes it can be used as a modem if the software is designed for it. However alot of software written for the falcon relies alot on the dsp56001 and taxes the available power it has. If you use the dsp in the falcon as a modem for the internet instead of an external modem, jpegs and any other software that uses the dsp would be alot slower. Using the dsp as a modem would be a good idea if newer falcons are developed with a 040/060 cpu, a faster dsp 56002 66/80 mhz, and faster custom chips where the dsp would have the extra cycles to spare and less software would have to use it to make up for the slow cpu.

I think there's an XBIOS call the lets you alter the logical and physical address of the screen, so you can draw on an "invisible" screen. At least on the ST models.

I know about that solution, but I wonder if it is reliable under multitasking.
What if at least 2 applications make this call ?

Wow. I think I will find information about offscreen drivers in a NVDI doc.
What is the VDI Enhancer ? What is EdDI ? Extended Device Interface ?
Is it an official feature from Atari or a independent project ?

Thanks.

DIM a(2,2) makes a table sized 3 x 3 and you only have data for 2 x 2.
Change the base from 0 to 1 or DIM a(1,1). I hope that MAT READ is
supposed to fill the array from DATA?

Thanks for the responses guys.

While it is doubtless that such software wouldn't make much (if any) money, I would be interested to see if it could be done. Shoot, my Linux friend is dying to get his hands on my 1040STe to try some new Linux variant on it. He's just wants to see if it's possible!

I wonder... If it were written, how would you connect the Falcon to the phone line? I suppose you'd have to build a DSP interface. Or was there something else in mind?

else
>in mind?

There was a special interface that fitted the DSP connector at the back of Falcon. I tried to remember and I know that Atari let all the ST magazines of the time know that they were just about to release 14.4Kbps modem software. I beleive they got the product ready but then they let it all go due to the price of it all.

You don't say what area of the cartridge port you need to know about - do you want to know how to electrically connect the EPROM to the cartridge port, or do you need to know what to burn into the EPROM?

Well to look briefly at the hardware:

The ROM cartridge uses a 40-way edge connector and plugs into the ROM port at the side of the ST. 128K of ROM is available in the address range $FA0000 to $FBFFFF. Having never used the port I can't say precisely, but it seems that the ROM3 and ROM4 select (active low) enable one of two banks to be selected in order to access the full 128K of space, my documentation is a bit vague on this. Otherwise the port looks quite straight-forward.

And from the Compendium:

There are two types of cartridge - diagnostic and application. Since you're interested in the latter, I'll skip straight to that. Application cartridges should contain one or more application headers beginning at location 0xFA0004 as follows:

Name Offset Meaning
CA_NEXT 0x00 Pointer to next app. header or NULL if no more
CA_INIT 0x04 Pointer to app init code. High 8 bits have special meaning:
Bit Set Meaning
0 Execute prior to disp. mem. and int. vec. init.
1 Execute just before GEMDOS initialised
2 Unused
3 Execute prior to boot disc
4 Unused
5 Application is a desk accessory
6 Application is not a GEM application
7 Application needs parameters
CA_RUN 0x08 Pointer to application's main entry point.
CA_TIME 0x0C Standard GEMDOS time stamp
CA_DATE 0x0E Standard GEMDOS date stamp
CA_SIZE 0x10 Size of application in bytes
CA_NAME 0x14 Null terminated ASCII filename in standard GEMDOS 8+3 format.

Unfortunately the Compendium does not explain exactly how the CA_INIT and CA_RUN entries are used.

The cartridge can then be accessed as a lower-case `c' drive, with the
applications listed like ordinary files.

>correctly.
>If I remove the mu_timer flag, everything works fine.
>Any idea why the aes gem message get messed up and not reliable?
>What Am I doing wrong?

I see only one possibility when you use evnt_multi() to know if there is
a message you must verify that evnt_multi()&0x10 is true and not verify
evnt_multi()==0x10 that is fault.

I know in GFA BASIC phy%=xbios(2) returns the physical screen address and logic%=xbios(3) return the logic address. Perhaps (If your using GFA) you could use logic%=xbios(3) to return the logical screen address, then use then set that to the current active screen somehow. All thte drawing functions should go to the logical screen and not be seen. You could then get the physical screen up and running again by using the physical screen address. As a matter of fact you should be able to swap the physical address with logical.

1561. CLI menu accessory

Newsgroup: comp.sys.atari.programmer

Hello,

I am looking for a good command line interpretor in the form of a desk accessory. It would have to run external programs such as gcc, make, etc. and be able to set envioroment variables.

I know I could use Mint with toswin and a shell like bash but that is a bit too complex for my needs.

If anybody could send any information via email on such an accessory I would be very grateful.

Thanks alot, Robin Grant.

Indeed. Try the NVDI v4 programmers guide (should be available from the Natural Born Programmers site, maybe on my site as well, if the link's still valid...)

: What is the VDI Enhancer ?

It's a little program written by the guys that did NVDI, to implement EdDI calls in existing VDI's (don't know if this'll work for all VDI's though...) It's freeware and should be on most FTP sites...

: What is EdDI ? Extended Device Interface ?

It seems to be some kind of protocol or standard to inplement extended VDI features. It implements offscreen bitmaps, some new calls to get more info on workstations and a few other bits...

: Is it an official feature from Atari or a independent project ?

It's independant. It was implemented in NVDI and MagiC and can be added to older VDI's using the enhancer, so it's pretty well supported. I hope it will be added to FVDI as wel...

Yes, you would have to have some hardware. I don't know the details of
what would be needed, nor how to make the DSP program itself. I
believe Motorola's DSP56001 manual mentions that the DSP _can_ be used
as a modem, but I don't know if Atari's implementation in the Falcon
allows for this. They skipped out on some things, e.g. handshaked DMA
tranfers, which is supported my the DSP, but not the Atari hardware.
There are ways around that thing though, kinda. :)

Yep. I remember that drive letter. That's what I'm trying to achieve,
except I need about 2 Mb worth of memory. I guess I'll have to use those
128 Kb for the small application that bootstraps drive 'd'.

Are you using the STOS sprite commands or some from an extension (such
as the missing link)??
If you are using the standard STOS ones, then all you have to do is copy
your forground screen display into the background screen. This
background screen is used to redraw the bits in the foreground where the
sprites have moved over.
e.g. screencopy logic to back
should do the trick i think

Hope this helps

Modern Atari System Software (available still from HiSoft?) contains the
object file formats for Lattice, GST and DRI. I'm not sure how much of
the debugging information is detailed in here though.

Craig Graham created a MiNT based source-level Lattice C debugger, and both
source and binaries are available from his WWW pages.

GDB sources are available, which should provide access to the GCC debugging
structures.

I have a Lakmeyer EPROM burner (made in the UK) which came with
"ROMdrive" software. I beleive this does exactly what you want to do,
although I have never used it. It makes the cartridge appear as an open
window on the desktop with whatever programs you have saved in the EPROM.

I also have a "Back Pack" cartridge, again from the UK, which
included a set of desktop utility programs (calculator, address book,
appointment calendar, etc.). I was pretty impressed with this cartridge
back in the days of the 520 ST with only 512K of RAM.

There is also some documentation on writing to the cartridge port
at Vezz's ST hardware web site. Sorry, I don't have the URL handy, but if
you can't find it, let me know and I'll look it up.

BTW, if anyone else is familar with or has the Lakmeyer EPROM
burner, I'd like to know what the latest version of the software is.

>I want imposible?

You could just set a flag then have another process (eg an accessory)
poll that flag in order to decide if data should be written. In
practice, it will probably involve implementing some sort of ring
buffer of suitable size so that no data gets lost.

A (possible) MagiC solution ...

In the MagiC header file MAGX.H one of the system structures contains
an "in_dos" flag. If this behaves in a similar manner to the flag of
the same name used in the PC world then it *might* be possible to do
it that way. If memory serves, the flag gets set when a dos call is
being made and is cleared when dos is exited. This makes it possible
for TSR's to make dos calls. They simply poll the flag until it is
clear - then they know a dos call can be made without re-entrancy
problems. This feature could allow an IRQ to make a dos call (subject
to timing constraints etc).

Some compilers (Lattice iirc) use a specialised "EVNT_MULTI" structure
which is neater than passing all those arguments. It also allows the
compiler to stack the strucure a bit more efficiently.

Perhaps that was what was meant?

>actually not my program, but VT52.

What sort of length are we talking about?

>Does anyone know if this is a known bug in the VT52 program, or could it be
>something I'm doing?

Either. I've had situations in the past where the program I'm developing appears to be ok whilst other apps intermittantly get kicked out and VT52 invariably bears the brunt of this as it is usually the parent process of my development programs. In almost all cases the bug has been mine - usually my prog corrupts some memory area belonging to another process which in turn may corrupt something else until the corruption reaches the point where MagiC picks it up, whereupon it kicks out the process which owns the corrupted memory block, rather than the one responsible for the corruption.

>If it's a bug, does anyone know if there is a more
>reliable replacement for VT52 under MagiC?

If memory serves, I did send my MagiC version 2 VT52 to someone (ah who was it?) with a later version of MagiC who had problems, and it solved it in his case.

>Thanks for any help,

On the assumption your app has no bugs then methinks the line length might be the key. Try fiddling with the refresh and buffering options and see if that has an effect (perhaps even try vt52 singletasking). We don't know the internals of VT52 so who knows, but it is feasible that if a given number of chars in a given font takes longer than a given time (iyswim) to be buffered/displayed then some internal limit may be reached.

You might also try MEMEXAMN at various stages in the crashes and hangs and compare them. This is the tool I used to figure out which process

was at fault. Although a bit hit & miss you get lucky eventually!

Don't bother. I only ever saw one CLI acc (years ago) and it didn't
work very well. The way accessories work with the system makes this
sort of thing nigh on impossible. :-(

If you must have access to a CLI while running another app then I
suggest you purchase MagiC. It has a window driven VT52 emulator
application which quite happily runs my command line driven MWC
compiler (and multiples thereof).

There's a newly started Basic tutorial in Atari Computing, and this would probably be a good place to start. You can also order the Atari Computing cover disk that included HiSoft Basic.

We're at cross purposes here. ;-)

I meant a printf() kind of form_print() where you passed a text string
to the function and it displayed that string. With this in mind you
can see why I mentioned the control codes (CR etc) below, to implement
some limited text processing.

>In addition, form_progress() would also lend itself to
>file downloading operations, user-decision/timeout
>activity, file format translations, and other
>hey-I'm-working-on-it / wait-until-I'm-finished

Yep. I was thinking of a textual "progress" form.

>>If you think about it, even if form_progress only
>>dealt with single lines you would still have to have
>>the ability to "word wrap" just in case the text
>>string was too wide for a particular resolution.
>
>Display text used in form_alert() is limited to a
>maximum of 30 characters per line, IIRC, making
>word-wrapping unnecessary.

The 30 char/5 line limit is nothing more than a cop-out by Atari. More
on this below.

>Using the same
>prompting mechanism in form_progress() (with an
>added progress bar, of course) would work in all

>resolutions, all the way back to ST low for those
>who enjoy looking at large, readable characters.

They could have implemented form_alert using a scrollable text area of user defined size: the system could have downsized this where it won't fit a given resolution and autowrapping would take care of the line length.

>As a bonus, using the same construction from a
>programming standpoint would lessen the confusion
>(and potentially reduce space demands on the RSC
>file) that occurs when two similar calls implement
>identical functions in different ways.

Due to the blocking nature of form_alert I really only use it for 'critical' errors. Given a file write error say, ideally you would want to display something like this...

Tos error number ??
{error message}
{filename}

... and as we need space for 30*5 chars plus a trailing nul plus the line break char (max 4 * '|') we need 155 chars workspace (assuming your limits are correct - I can't remember offhand and it doesn't alter my point anyway). Then we have to figure out where to insert the '|' so that no line is over 30 chars, only this looks messy so we need a better algorithm which attempts to insert the '|' over whitespace chars (if we can).

In my case I have no idea how long {error message} is going to be as I obtain it from errno.h not from the resource file. That aside, we have no idea how long {filename} is going to be either. The total could exceed 155 chars and we are in trouble.

Thus as far as I am concerned, sticking to the limits presents me with more difficulties than rewriting form_alert from scratch (which I have done)!

>>This in turn requires the generation of an object
>>tree on the fly so that the required amount of

>the programmer).

This can be done with a dynamically generated tree.

>It's not necessary to open a window to display a
>form_alert(), IIRC,

That is correct.

>and I don't envision opening a
>window to display a form_progress() although a
>window-like handle might be needed to handle updates
>to the progress bar (i.e., 100, 237, 862, all the way
>up to 1000) since the form is supposed to be non-modal
>in nature.

There are two ways of looking at modality. A given object is either
modal to an application or non modal to an application. With the
former, the application will block until the modal object is removed.
With the latter the application may continue reguardless.

The "form" library is useless in this respect because it is neither.
In essence it is modal to the system and causes all applications to
block the moment they attempt to perform a visual change. This is why
your form_progress needs a window!

>Does form_alert() really generate an object tree
>on the fly?

I doubt it. Otherwise it would not be as limited as it is. I would
imagine the AES has a single "fixed" tree containing the maximum
required objects then simply unlinks those which are not visually
required from the tree.

>>Having gone to this much trouble you might as well
>>add in the ability to process simple control codes
>>such as CR,

I meant that if those codes occured in the text string they would be
interpreted as simple control codes.

Hi,

I'm developing a Pearl90 compiler on my Mint-ed Falcon030 with gcc. I have
FreeMint 1.12. Now, when I execute the [Pearl] compiler on certain sources
(which are meant to stress my compiler), Mint totally blocks. The cursor
stops blinking, no more disk activity, virtual consoles don't work anymore...
Is it possible that the Mint kernel itself crashes ? I suspect my problem
is triggered by some NULL pointer somewhere, but I have memory protection,
so normally it should be caught, no ?

Start sending those comments, please !

Hi,

there is a german book 'ATARI ST Profibuch', which explains the cardridge HW
and how to write a program to make it run from there. Maybe the book was
translated to english ?

The books number is ISB N 3-88745-501-0 from SYBEX, Authors Hans-Dieter
Jankowski, Julian F.Reschke, Dietmar Rabich

maybe this helps

I think you need more values in the DATA statement. DIM a(2,2) would
allow 0,1, and 2 in both directions. You can either add more values
or add MAT BASE 1 at the top of the program. It depends on if you
need the '0' element or not. Hope this help...

From: Katherine L Ellis <kellis@primenet.com>
Message-ID: <Pine.BSI.3.96.980513185300.2296D-100000@usr07.primenet.com>
Source record: 4406

Why is the clipbrd need to be totally emptied when copying to it?

Example, in my prog I dump some info in the clipbrd.
A user (with the help of the compendium) told me that I should erase
the whole content of the clipbrd folder (scrap.*).
I find this a little stupid, and can find any good reason. Anyone has
a logical answer to that? so I THEN migh follow that way of doing.

Also, should I lock the clipbrd folder when using it from my code? if
yes, why? (considering that it is running under MiNT).

Thanks

>Can anyone help (quite soon please)? :)

I have used the MAT commands however the manual states there is a
MAT BASE command much like OPTION BASE. I think a() would have the
range 0,1,2 for each dimension thus you don't have enough values in
your DATA statement. This would result in the error.
Try adding 2 more values to the DATA statement or adding MAT BASE 1
to the top of the program.

Hope this help...

I remember having to do that as well. Usually when I'd wanted a long value
returned, rather than an int. I think Sozo came out 'bad second declaration'
or something similar.

I've not witten anything that big, although I've managed something in the
region of a couple of hundred errors. Forgot to include a couple of
#includes at the start :( Put them in, added the ';'s that were missing
and no more errors (until it ran)

The 'joys' of trying to use windows I gather. I think I'll keep what little
sanity I have just a bit longer ;)

>

> run Sozo!

It seems to do so here, in a nice little vt52 window. This is nice in that
I can leave the output window on screen and correct any errors that have
come up. The only trouble I've got is I don't have a debugger that will work
under Magic. 'Tis a bit of a pain when trying to sort something out. To
get round it I debug under TOS and then check with Magic just to make sure.

>the language I'm using is Sozobon C v2.

Try this ...

```
extern int16 gl_apid;

#define SH_WDRAW 72
#define WH_DESKTOP 0

main()
{int16 msg[8];
int16 which =-1;
int16 apid;

apid = appl_init();
msg[0] = SH_WDRAW;
msg[1] = gl_apid;
msg[2] = 0;
msg[3] = which;
appl_write(WH_DESKTOP,16,msg);
appl_exit();
exit(0);
}
```

... and from the MagiC 2 manual ...

"The shell is informed by the application that the contents of a drive have changed and so the shell window should be updated. The drive numbers are specified in msg[3], whereby 0 zero means drive A:. If msg[3] is -1, all windows will be updated by the shell. This message is supported by MAGXDESK, EASE3 and GEMINI 2."

Note:
I've used 'gl_apid' as I'm not sure if Sozobon is one of those compilers which mangles the return value from appl_init(). If it doesn't then take out the 'gl_apid' stuff and use 'msg[1]=apid'

instead. ;-)

I don't use STOS either ...

A 'blit' (Bit Line Image Transfer iirc) is simply the term used in the
Gem world for copying an image from one place to another.

A 'transparent' blit is such a copy performed so that the image
background remains the same. That is, we're talking "OR" mode.

Look at the STOS command which is moving the images (sprites) and see
if it has a "mode" parameter. If it doesn't then you might be using
the wrong command. Assuming the command is correct then you could have
to look at the sprite foreground and background masks (if such items
exist).

>Hello,
>I need YOUR help.
>I've been using my ST to make music for years. Now, having been inspired by
>Electronic Cow and others, I want to learn a bit of programming.
>Unfortunately I know NOTHING.

If you have never programmed at all before then you might get put off
if you tried C first. This is because if you tell it to do something
stupid it will usually *do* something stupid simply because it assumes
you're the boss and know what you are doing. This is what makes it so
powerful - and so difficult to debug!

>Are there any essential bits of reading to do? On-line, or are there books?

Grab a few general purpose C and Basic books from a library and see
how you get on with understanding them.

>Should I be learning C, or some kind of Visual Basic?

If you mean 'Visual Basic' as in the Windoze equivilent then there
isn't one. There are Basic interpreters and compilers though.

C doesn't actually have many commands so it easy to learn the language
itself. Its power comes from the flexible ways it can manipulate data
and its ability to let you add your own commands (called functions) to
it so that they become part of the language. There are also an awful
lot of prewritten functions which you can use. Some of these are
"standard" ones (which a general purpose book will teach you) then
there are the non standard ones for accessing the Atari operating
system for example.

Thus, if you do choose C, any "standard" stuff you learn will be
useful on any Ansi compiler on any machine.

>What about compilers?

Generally, compilers are best for creating programs and interpreters
are best for learning to program. On the other hand I only know of one
C interpreter and it hasn't been supported for years.

>Where, in other words, do I start?

If you choose C then get an ANSI conforming compiler and some general
purpose programming books. You don't want anything "machine" specific
to start with. Just learn the stuff which is common to all C compilers
(which is all a decent general purpose book should cover). When you're

happy with that then try some Atari specific stuff.

>I'd really appreciate any help you can give me.

Lattice and PureC are the two Ansi compilers. You should be able to get one second hand. The manuals will have most of the Atari specific stuff in as well actually, aside from how to compile with the darn things of course!

I have an ancient atari book somewhere that has some details on hardware and software. The downside is it was badly proof-read and has many errors (although for all I know the cartridge info may be fine). I could root around for it if you want and scan the relevent pages?

>>>MAT READ a()
>>
>I have tried having 15 numbers in the DATA line (which should be more
>than enough) and I still have the same problem :(

Tried using RESTORE before MAT READ? After one read the internal pointer is pointing to next unread value and next read would cause a "Out of data" because there's no more DATA to read. e.g. this won't work

```
DATA 1,2,3,4
DIM a(1,1)
FOR i=1 TO 10
MAT READ a()
NEXT i
```

but this will:

```
just_a_label:
DATA 1,2,3,4
DIM a(1,1)
FOR i=1 TO 10
RESTORE just_a_label
MAT READ a()
NEXT i
```

"just_a_label" is a point where the next READ will happen.

Haven't tried these...

Actually, Face Value (http://home.sol.no/~veg/faceval.html) comes pretty close to being a kind of "Visual Basic", using GFA Basic. Version 2 is released, but the website is not updated yet.

I haven't found much deviations between the ANSI standard and Pure C.
I think it is save to call it an ANSI C compiler. It is at least
not a K&R compiler.

Its been a LONG time since I touched standard STOS sprites, so I'm a little shakey on how they work...

> >Well could'nt find and transparent in the manual or a blit :(However I
> >now know around what lines I'm looking for.

It sounds like you are using the standard STOS sprites (most people dont anymore, as extensions such as TML give MUCH faster sprite routines), so here are a few commands to look up: "sprite", "autoback", "update", and "screencopy".

TML's "bob" command gives much better performance, but restoring the screen is harder

> I don't use STOS either ...
>
> A 'blit' (Bit Line Image Transfer iirc) is simply the term used in the
> Gem world for copying an image from one place to another.

Yes, there are various "blit" commands - STOS's command is called "screencopy", although the blitter extension, Misty, and The Missing Link all provide blit-type instructions under various names (as well as the Falcon aware copy in my extension).

> A 'transparent' blit is such a copy performed so that the image
> background remains the same. That is, we're talking "OR" mode.

When drawing sprites via the "sprite" command, STOS always automatically respects a transparent background.

> Look at the STOS command which is moving the images (sprites) and see
> if it has a "mode" parameter. If it doesn't then you might be using
> the wrong command. Assuming the command is correct then you could have
> to look at the sprite foreground and background masks (if such items
> exist).

They exist, but the STOS programmer doesn't get to see them while writing the code. If using standard routines, it should handle a certain amount if it for you. The important bit with STOS is the "back" and "logic" screens (draw to logic, restore from back, and physic [sometimes same as logic] is what is displayed on screen).

> select()) when they occur.

Sure, but there is no performance benefit. Still each application that needs
this has to employ it's own evnt_multi() thread, so the same kind of system
blocking occurs if several such programs run at the same time.

The situation would be eased though if all such applications could query a
common program for doing this, so that only that single program needs to
do evnt_multi() with MU_TIMER all the time. However, it's *very* unlikely
that a significant portion of programmers would achieve to agree on such
a mechanism. This would be different if it were built into the OS.

Chaos. There is very good reason why Atari strongly discouraged use of
Physbase, Logbase and Setscreen. Also, it's not portable, i.e. won't work
on most modern machines.

You'll have bad luck. Accessories may not launch other programs under
SingleTOS, this is due to OS internal limitations. So you won't find any
such thing that works reliable.

Go for true multitasking, you'll like it ;-)

Katherine L Ellis <kellis@primenet.com> writes:

> Why is the clipbrd need to be totally emptied when copying to it?

It isn't. Only all files matching "SCRAP.*" need to be deleted. Reason
is data consistency. What do you expect a both graphics and text tool to
insert from the clipboard, if some (other ?) graphics tool copied some
graphics (SCRAP.GEM) into the clipboard but forgot to delete the text
(SCRAP.TXT) that was copied there before by a text editor ? Ambiguity
is even worse if a word processor wrote some SCRAP.RTF and a text
editor writes a SCRAP.TXT but does not delete the RTF.

It is not stupid but absolutely necessary, see above.

> a logical answer to that? so I THEN migh follow that way of doing.
>
> Also, should I lock the clipbrd folder when using it from my code? if
> yes, why? (considering that it is running under MiNT).

Probably not, I guess it is not the purpose of the clipboard to get some
SCRAP file and then get locked so that no other program can access it.

: Why is the clipbrd need to be totally emptied when copying to it?

: Example, in my prog I dump some info in the clipbrd.
: A user (with the help of the compendium) told me that I should erase
: the whole content of the clipbrd folder (scrap.*).
: I find this a little stupid, and can find any good reason. Anyone has
: a logical answer to that? so I THEN migh follow that way of doing.

The short answer is consistency -- so that the clipboard behaves the way the user expects it to, the way it does on other platforms. Remember that programs using the clipboard are supposed to write out as many formats as they can to the clipboard folder when cutting or copying. Papyrus, for example, might write out SCRAP.PAP, SCRAP.RTF and SCRAP.ASC. Programs reading from the clipboard are supposed to use the format with the maximum information content. Now suppose I'm using EvereST to edit some code which I'm going to insert in a Papyrus document. EvereST will write out SCRAP.TXT or SCRAP.ASC to the clipboard when I'm transferring the code to Papyrus. What happens if EvereST _doesn't_ erase everything in the clipboard folder? There might still be SCRAP.PAP and SCRAP.RTF from previous use of the clipboard by Papyrus in the folder. Papyrus will load these, rather than the desired SCRAP.TXT/SCRAP.ASC, since they contain more information, but that's not at all what I would want in this no-so-hypothetical situation.

: Also, should I lock the clipbrd folder when using it from my code? if
: yes, why? (considering that it is running under MiNT).

Why bother? I just checked the man page for flock() (to "apply or remove an advisory lock on an open file"). Since the locks are advisory, they are not enforced by the OS; if programmers don't check for them, they can be ignored, and will be ignored by every non-MiNT-specific application. Also, it's hard to imagine a situation where two processes would be accessing the clipboard "simulataneously", since every action with respect to the clipboard takes place at the behest of the user, and the user interacts with only one application at a time.

The world's first palmtop computer! The Atari Portfolio runs MSDOS applications and comes with a suite of built-in software including calendar, addressbook, text editor, Lotus-compatible spreadsheet, and file-transfer utilities. Plus there are plenty of third-party shareware apps, including games and productivity tools, available for download. This package includes the Atari Portfolio, a parallel port adapter so you can hook it to your desktop for file transfers, a 64k storage card, manuals, and AC adapter. This is a real collectible! Buyer pays shipping. For more info on the Portfolio, check out this page:
http://www.ncsc.dni.us/fun/user/tcc/cmuseum/Portfoli.htm

The auction is at:

My (rather stock) Falcon is a bit too slow to play say more than 4 or five
voices at the same time with velocity (or medium) in action. I need to go
back to the 'cut' option and then it's ok.

AB040: the word that kills (even the thought empties my purse ;-)). Maybe
the forthcoming 'Centurbo 2' will give some punch to My Falcon. It'll be
less than the price of an AB040...

Bye,
/Pascal/

Anybody know who the former textile executive was (is?) who headed
the Warner Entertainment Conglomerate and drove Atari into the
toilet. As described on pages 324-325 of Steven Levy's 'Hackers',
he refered to the hackers who designed and wrote Atari's games as
'towel designers'. Mr. Levy chose not name him, as there wasn't much
good to be said of him, but I'd like to know his name, if he is still
breathing, and what he has screwed up since.

Thanx in advance.

Bonsoir,

Dans l'article <6jem7t$mvq@balaena.bio.vu.nl>,
Levien van Zon, <lvzon@bio.vu.nl> a ecrit :

>>: Has anyone ever attempted a port of a GEM program to X11 Windows
>>: and/or Windows 95?

I'm doing that now, for X11 R 6.
For the moment, it's mainly a kind of common library for GEM and X,
based on GEM & VDI. But it should be possible to complete it so that one could
directly use GEM functions [in fact, a few of them are already made, as
menu_bar, rsrc_load or evnt_multi [partly]].
For an example : see

http://www.eleves.ens.fr:8080/home/curis/anneau.html [in French...]

where you can download
- the GEM version of the programm [exafs.zip]
- the X code of it, ready to recompile [well, if everything is ok :-)]
[XExafs.zip]

so you can compare :-)
The only big thing currently missing [for the needs of that
programm... that means, in that common-library] is the file selector.

For the moment, the X version has been tested on falcon/linux,
Sparcstation/SunOS [machine I use to develop], SGI Indigo II/Irix, PC/Linux &
DEC-alpha/linux.
Currently in development, so don't expect too much :-)

For more informations, please ask...

For the Win95 version: if somebody wants to adapt, I'll be very happy
:-) [I think W95 programming is closer to X11 programming than to GEM
programming, but I'm not sure...]

>>A while back I heard rumours about a library for X designed to port Atari
>>programs. Sort of a GEM implementation on X. Anyone know if this exists?

May be it answers your question (ever if I don't know if it's this one
you're speaking about...)

Okey. I don't know where the limit is on my computer but it's higher than that.
With EXPAND I can atleast play more than 16 voices if I use 8-bit sounds. If I
use 16-bit it lowers a bit.

My understanding was that the ST didn't really have sprites and that it
was just emulated in the software.
(perhaps to take advantage of a later hardware upgrade?)

There was a Dutch version of the old Profibuch. I have got all versions:
1 old German
1 dutch translation
2 new German
One new German copy is at the university, the old and the new German
are at home and the dutch version is at my parents home. So I always
have a reference manual to the Atari at my elbow.

Erm, it is true that the ST doesn't have hardware sprites (although line-a,
part of the OS of older machines had sprite routines), but the question
was specifically about sprites in STOS - a games programming language - which
provides sprite routines.

1627. Spec-Tech

Newsgroup: comp.sys.atari.programmer
Date: 1998-05-18 00:00:00 UTC
From: bwarren@ibm.net
Message-ID: <3560CD46.934@ibm.net>
Source record: 4440

Here I go again. I'm having no luck looking for the code examples for spectrum. It's really depressing that I lost the code I had years ago. I used to have some code (which I modified) that would allow you to draw in spectrum mode in GFA. You could create graphics on the fly. I modified it for several routines to animate and rund super color graphics.

I wish I could remember where I got it from (a magizine, BBS?) I wish I could find something simple (or write it) to handle rasters (like neocrome does.)

I've pretty well given up on the overscan (not that important really) but I still search for code examples using Spectrum. I have a displayer, but not one that can modify the graphic.

Maybe if I could create a spectrum-compatible file and display it! Ah that would be cool!

Could anyone help? Anyone played around with the old spec-tech or with rasters? I'd love to be able to raster a scan line and use the cool technique many games do for extra color.

-Thanks for anyone's wisdom.

Message-ID: <6jrmq6$il2$1@nef.ens.fr>
Source record: 4444

Bonjour,

Dans l'article <Esy650.nKs@suse.modem.stud.uni-hannover.de>,
Peter Rottengatter, <perot@pallas.amp.uni-hannover.de> a crit :

A little while ago someone mentioned that he's working on a library for
both GEM and X-Window that would make an X program out of a GEM application
by just recompiling. Dunno how far he's got.

-> the part library of common functions for X & GEM/VDI is in good
progress. That means, if someone wants to start a new development and wishes
to make it usable on both X & GEM, I think he can use it.

-> the part recode the GEM functions is not really started, so just
recompiling an existing soft doesn't work for the moment.

Anyway, a simple porting will never be enough, essentially because of
some choices under X : each objetc is a window, which means that (for
simplicity) changing an object size by OB_HEIGHT() won't have any effect till
the tree is closed and reopened. One must use my own functions for that (that
means, for instance, to do a slider...)

More details on demand...
See the address given in another message for an example.

AFIAK both the new and the old version are sold out. You will have
to find a store that has some still on stock.

The old Profibuch is the first edition, original title:
ATARI ST Profibuch
The new profibuch is called:
ATARI Profibuch
ST - STE - TT
The books were re-printed at least 10 times as I have got the
tenth printing.

1633. Whiteline Linux 2.0 CD Installation

Newsgroup: comp.sys.atari.programmer
Date: 1998-05-19 00:00:00 UTC
From: strads@tmisnet.com
Message-ID: <35619f10.1547477@news.tmisnet.com>
Source record: 4446

I picked up the newly-released Linux 2.0 for
Atari CD and discovered that it has the same
problem I've found on previous releases
(Toad, etc.). It's simple, really: you can't
load the Linux OS until you've got the Linux OS
already running.

In this case, it means I cannot even open the
folders containing the code! All I can do is
read the README files (using a German to English
translation program) that apologize for the fact
the instructions are not in English.

<sigh>

I've visited the various Linux-for-Atari websites,
and I'm pretty certain about the need for ataboot,
vmlinux, and newfilesys -- but they're not included
in an executable form for single-tasking GEM!

So I'm stuck. Again.

Has anyone else been able to install Linux 2.0 from
the CD, using only the CD?

Thanks!

1638. My C-Lab Falcon MKII

Newsgroup: comp.sys.atari.programmer
Date: 1998-05-21 00:00:00 UTC
From: angief18@aol.com
Message-ID: <1998052116043300.MAA29438@ladder03.news.aol.com>
Source record: 4351

I have a C-Lab Falcon MKII which I purchased from Toad Computers 2-3 years ago. Since December of last year I had been having trouble booting the Falcon with the cdrom drive and scsi cable connected to the Falcon's scsi port. Every time I tried booting the Falcon in this way, the boot partition would become corrupted and I would have to reload the boot files. The other day, I tried it one more time and the worst happened...the Falcon no longer operates. The fan comes on, the hard drive starts to spin up, and nothing else happens. I disconnected the hard drive and tried to boot from floppy---nothing. The fan comes on and the power indicater light comes on but that's it. No floppy activity. Does this mean that my $1400.00 computer is now junk? I am now very frustated, sad, and angry. What can I do now to rectify this situation that won't cost me an arm and a leg to fix? All I really want to do is to get the machine up and running again in order to be able to use it as trade in for a TOS clone motherboard/cpu.
Thank you,
Sam Ferrer

NeoDesk combined with the NeoDesk CLI can launch any TOS or GEM-based
program reliably, with any version of TOS. It's all in the way the CLI
tells NeoDesk to run the program, rather than running it itself.

Date: 1998-05-22 00:00:00 UTC
From: rcain@zetnet.co.uk
Message-ID: <6k4674unm2@roch.zetnet.co.uk>
Source record: 4353

I don't know a lot about MiNT but I am trying to install the system on this TT. I am using the 1.14.6 version in the MINT030.PRG configuration.

The first thing I notice is that it will not recognise drives beyond P:

Is this a restriction on ALL MiNT versions or is there some .CNF parameter which I can use to extend the drive map?

Roger Cain, Manchester, UK NeST:90:100/103
TT 6Mb/MagiC 5/NVDI 4

1641. objc_change(...,SELECTED,1) doesn't work ?

Newsgroup: comp.sys.atari.programmer
Date: 1998-05-22 00:00:00 UTC
From: frederic.dinh@hol.fr
Message-ID: <6k4bkj$988$1@news4.isdnet.net>
Source record: 4354

Hello all,

I wonder why objc_change(... DISABLED,1) or any other ob_state works, but not with SELECTED.

If I want my button to be redrawn immediately, I have to use objc_draw(). This occurs under TOS 4.01 and Magic 5.13.
Thanks for all answer.

It does.

>and that it was just emulated in the software.

Sort of true. Sprites "just are" - how they are implemented is nothing
to do with sprites themselves. On the ST sprites are implemented via
the LineA interface. The LineA refers to a set of unused instructions
in the processor, all of which start with an opcode of $Axxx, hence
the name (there is also a LineF on the 68000 as well). LineA and LineF
cause a processor exception, the handler for which dispatches the
processor to the required routine.

>(perhaps to take advantage of a later hardware upgrade?)

LineA calls will take advantage of the blitter chip if one is fitted.
Perversely, recent software add-ons are so efficient that greater
speed can be obtained by turning the blitter *off*!!

Others will be able to advise if there are suitable libraries which
provide this.

Failing that you have two choices. "Bodge" it or do it yourself.

Bodging
=======
This works very well for simple output. You just create an object tree
with G_STRING or G_TEXT objects in it and write the lines to them, and
a scroll can be implemented quite easily. Being a tree in a window the
rest of the code is not much different from any other windowed tree.

Do it Yourself
==============
This can be as simple or as complex as you like. For a monospaced font
it isn't too hard. Maintain a "console buffer" somewhere in memory and
write to that. Update the screen from the console buffer when
required. The more features you add to the console the more work is
involved (bold, underlined, colours etc) as these must be remembered
in the console buffer as well.

Proportional fonts are trickier because not only do you come up
against the problems of implementing it, you are forced to figure out
how to do so in such a way that output doesn't slow to a crawl. Use
baseline alignment.

The single most important thing you can do to increase speed is
perform "line/string" output rather than character output. This is
especially true with proportional fonts. Prefill the background then
use v_gtext in transparent mode, it's faster. Save the results of
vqt_extent in an "extent" buffer because it takes nearly as long as
v_gtext does.

I don't use MiNT but even so, I'm not too sure what it is you are
wanting to do? Is it some sort of idea like the one in MagiC where
processes are *killed* prior to (say) a resolution change?

>Anyone knowing a clean AES-method for this?

Only the usual one - send each application a shutdown message keeping
your fingers crossed they all respond.

>Otherwise a tricky solution
>with GEMDOS/ BASEPAGE would help me, too.

Is there a SIGABORT type signal? Perhaps you could hack the process id
and issue it to each process killing them that way? Dunno really - a
wild guess!

Respond? Uh-oh ... I thought sending an acknowledgement
caused an error, so I merely cause the application to exit
when it receives a shutdown message from the pipe.

1648. Need original 600XL/800XL OS binary file

Newsgroup: comp.sys.atari.programmer
Date: 1998-05-24 00:00:00 UTC
From: "D.J. Hatfield" <ldw9e@virginia.edu>
Message-ID: <3567E0B5.AE2@virginia.edu>
Source record: 4361

Hi all,
I Happen to have a non-functional Atari 600XL. I have used a Universal Device programmer to test the individual logic ICs and was able to locate one bad IC. However, just replacing that one IC did not work. Further investigation revealed that the OS prom was getting really HOT. I popped out the OS prom and read it with a Universal Device programmer which revealed no data (i.e. the prom was dead). I have been searching everywhere on the web for the 600XL's original OS binary file so I can program a 27128 EPROM and get my machine back up and running (to no avail). Would anyone happen to know where I can get this file or where I can get a comparable OS that would let me boot up into BASIC? If anyone out there has one of these machines and access to an EPROM/PROM reader, could you possibly copy the OS prom to a binary file and send it (email) to me? The part number on the OS prom is CO615988B.

Any help with this would be greatly appreciated.

Best Regards,
D.J. Hatfield

There's an ACC, DIR_2000, which will read a directory and gives the
option of display/print/write an ASCII file- options include how much
information about each file or folder you want including. You would have
to edit the result for your particular requirements.

Ay, there's the rub! I have been using Hisoft C (interpreter) for some time, having decided it's about time I moved on from Modula-2, but it doesn't like my Falcon AB40 (it's very unforgiving about non-standard screen resolutions) and very slow for serious work. I have obtained Lattice C (compiler), and followed all the instructions I can find about porting Hisoft C programs- "Normally fairly simple, requiring few changes to the source code" it says. The problem is with the Hisoft C toolbox- at link time, all the routines I use from the toolbox report as missing. Anyone sugest what stupid mistake I am making?

Hisoft no longer provide helpline support for Lattice C- the people who know about it left last year.

Well I'm using the normal STOS sprite commands for now because it is
nothing major and does not require alot of speed e.t.c. I tried this but
the problem is not that the sprite leaves behind a trail as it falls but
the problem is the sprites backgound color. Such as if I had the letter O
I want ot be able to see what is underneath the O through the center.
Therefore, I need to sprites background color to be see through.

Scott.

1652. GEM text input questions

Newsgroup: comp.sys.atari.programmer
Date: 1998-05-25 00:00:00 UTC
From: lvzon@bio.vu.nl
Message-ID: <6kc3u5$lkj@balaena.bio.vu.nl>
Source record: 4365

Hi everyone,
it's the irritating Dutch bloke without a Compendium again,
with two little GEM related questions:

I've been working on a new (more or less OO) dialog handler/manager for
a while now, but ran into a few problems yesterday with the keyboard
input handler...

Firstly, what is the best way to get the ASCII value of a key when
pressed simultaneously with ALT? I'd assumed that the ASCII value
would be returned in the low byte after an event, but to my surprise
I only got the scancode back, and 0 for ASCII. I think I'm beginning
to understand why people have language incompatibility problems
with ALT+[key] combinations... Anyway, what is the best method to get
the ASCII value of [key] in this case?

And secondly, I can't get objc_edit() to work. It should be simple
enough, but no matter what I try, nothing seems to happen. I can't pass
any keys, I can't even get a cursor... I use Sozobon's XGEMFAST
lib and call objc_edit() in what I think is the correct manner:

```
objc_edit (tree, obj, key, &pos, mode);
```

First with mode EDINIT (same as ED_INIT, depending on which lib is used)
to init the edit field, then with EDCHAR for each character entered
into the field (scancode stripped for valid ASCII chars),
and finally with EDEND on leaving the field...
I checked the input values, they seemed fine, and the return value
was 1 in all cases (which means that there was no error).
Anyone got a simple working example or can tell me what I could be
doing wrong?

Thanks,

I would guess that the data is in standard ST palette format. Assuming that you got you info from "ST Picture Formats" by David Bagget, look at the top of the file. The palette format is in the Introductory Information.

: Also, how does it display on the screen? Does it break the screen up

Hmm, from what I can remember, the display routine "simply" changes the palette three times per scanline.

?? MiNT relies on GEMDOS, so it won't recognise drives beyond P unless
you install something like BigDOS or perhaps MetaDOS (not sure about
MD).

I believe the low byte contains the ASCII value for a few ALT key
kombinations. So I'd suggest to check for a zero, and use the value
if it's not zero, and do something different otherwise. I'm not sure
though what would be the smartest thing to do in that case.

That's about correct.

Dunno. Maybe you should post a piece of your source code. I never had
problems when using objc_edit().

Have the external TOS program launched parallel, i.e. non-blocking. Before
launch, Fforce() it's stdin and stdout into pipes, the other end of which
are read/written by the launching program and displayed in a window.

Ah, this would explain a lot. I had been under the impression that
MiNT replaced the WHOLE OS (like Magic). So ..I just need a better
DOS.

```

That might be a sensible way, but maybe not what Levien was asking for.
That table contains the codes for the keys without any of Shift CTRL or Alt
keys, while he explicitly asked for the kombination with Alt. The XBios
Keytbl does not provide access to Alt kombinations.

: Dunno. Maybe you should post a piece of your source code. I never had
: problems when using objc_edit().

These are the two routines that deal with objc_edit(), for now
(the redraw routines might also want to do so as soon as I can
get this to work...)

The problem is simple: nothing happens. No cursor, no input...

```
------------------------------------------------------------------------

/* Compiled using SozobonX version 2-point-something and XGEMFast */

/* Set new editable object */

short new_edit (XDIAL *dial, short obj)
{
/* [Stuff removed] */

if (dial->tree[obj].ob_flags & EDITABLE) {

if (curr_ed_dial != dial) { /* Disable editing in old dialog */
if (curr_ed_dial->obj_edit >= 0)
objc_edit (curr_ed_dial->tree, curr_ed_dial->obj_edit, 0,
&curr_ed_dial->edit_pos, EDEND);
curr_ed_dial = dial;

} else if (dial->obj_edit >= 0) /* Disable previous field */
objc_edit (dial->tree, dial->obj_edit, 0, &dial->edit_pos, EDEND);

dial->obj_edit = obj; /* Set new field */
dial->edit_pos = 0; /* Reset cursor */

objc_edit (dial->tree, obj, 0, &dial->edit_pos, EDINIT);
return (obj);

} else
return (NO_OBJECT);
}

/* Parse keyboard events */
```

```
short Xdial_ParseKeybd (XDIAL *dial, short key, short ctrl)
{
/* [Lots of Stuff removed] */

if ((key || raw) && dial->obj_edit >= 0) {
if (dial->tree[dial->obj_edit].ob_flags & EDITABLE) {
objc_edit (dial->tree, dial->obj_edit, key, &dial->edit_pos, EDCHAR);
}
}
}
```

I'm making a little electronic assembly (made by me!) and I'd like to use
it with the parallel port on my atari (1040ste).
So I gonna make a program with the gfa basic 2.0 and I'd like to know how
to :
1) get the condition of a pin
2) set or reset some other pins
I think it's feasible with peek and poke.

```

Dearest Peter, this is what he asked for:

```
>Firstly, what is the best way to get the ASCII value of a key when
>pressed simultaneously with ALT? I'd assumed that the ASCII value
>would be returned in the low byte after an event, but to my surprise
>I only got the scancode back, and 0 for ASCII. I think I'm beginning
>to understand why people have language incompatibility problems
>with ALT+[key] combinations... Anyway, what is the best method to get
>the ASCII value of [key] in this case?
```

So what he wanted was the ASCII value of `key', and I gave him a neat way to get it. The ALT value can simply be gotten from key_shift after a keyboard event.

I don't see any key or event values passed to this function, nor is
there a key value passed to objc_edit, so I get the the itchy feeling
that you're not in an evnt_multi() loop. You do realize, I hope, you
have to be in an evnt_multi() loop and call objc_edit() for each
keyboard event?

1674. Text output via the VDI

Newsgroup: comp.sys.atari.programmer
Date: 1998-05-29 00:00:00 UTC
From: rand@cd.chalmers.se
Message-ID: <6km2bk$j22$1@nyheter.chalmers.se>
Source record: 4387

While trying to finish up fVDI v0.85, I've run into problems with two applications: CAB and AtariWorks. For some reason, those two programs insist on drawing text on _very_ widely separated lines under fVDI (well, AtariWorks is usually OK with a file that has just been loaded, but as soon as I try to change anything, things break down).

I'm pretty sure I've got all the normal character and string size functions right (after all, no other program I've tried exhibits these strange problems), but perhaps there's something I might have missed? Strange as it may sound, I have very little previous experience with the VDI.

If anyone has any ideas about what might be going wrong (or have some similar program (doing 'advanced' text output) and would be willing to test it with fVDI), please let me know.

There's no use trying to test this with fVDI v0.84, since that is nowhere near as good as v0.85 at these kinds of things. There is a small archive (only engine and monochrome driver) of fVDI v0.85c on my ftp site (/pub/Other/fvdi_085c.lzh), however, which is only a week old. If you attempt to use the newer fVDI, please get in touch with me.

It SHOULD but it does not ! The fact is that the MiNT's memory
protection si lame, and it doesn't protect a lot ! If you have a NULL
pointer problem, try to look at YOUR program first.

I don't think you'll be able to do this with peek and poke, but you should
be able to do this with INP(1) and OUT 1,xx. Another thing you can't do is
find out if there's a character waiting to be read from the port, although
you can see if it's ready to receive one.

>missing. Anyone sugest what stupid mistake I am making?

The most obvious one is a link problem - essentially not specifiying the object library which contains the functions. Probably the best way to start figuring this out is to take the simplest Hisoft program you've got which is failing and make a note of the function names that fail to link with it under Lattice. I would be surprised if things such as printf() were failing to link for instance (unless you've made some wierd alterations to Lattice without realising). With Hisoft being interpreted it wouldn't suprise me if the "ease of use" philosophy extended to linking also, so it may be pulling in library functions that do not exist under a "standard link".

I don't use Lattice but I'll explain how Mwc does it which will get the idea across ...

Mwc has four separate object libraries. The standard one contains "standard functions" such as printf(), malloc(), memcpy() etc - all the things common to a C compiler on any machine. Lattice probably has similar.

There is also a maths libray which has to be specifically linked by me. If I forget it then such functions as tan() ans sin() fail to be resolved at link time. Lattice probably has similar.

The two other libraries are to do with Gem. One is a library
containing all the VDI function calls. The other contains all the AES
function calls. Again, I must specifically tell Mwc to scan these
libraries during a link other such functions as v_gtext() or
appl_init() will not resolve. Lattice probably has a specific option
for linking Gem programs within the workbench.

The most important two things to check are these ...

a)
The path to the object libraries has been specified correctly. I dunno
how you do this. It might be specified in the project file or you
might set a variable in the workbench. I can't help with this as I use
a 'makefile' with Mwc. I believe Lattice can do so also but iirc this
feature is nowhere near as easy (or desirable) to use as a project
file within the workbench.

b)
That the project file being used is valid.

Finally, I assume there was an original installation program. Check
the options on this as it might have been possible to install in such
a way that the libraries never got transferred.

In any case, a list of some of the unresolved function names will help
us sort it out.

>Hisoft no longer provide helpline support for Lattice C- the people who
>know about it left last year.

Hmm, that's a shame. Pity they couldn't have posted their support docs
as public domain.

Terminating quietly is the correct "response". You only need to reply
(with AP_TFAIL) if your application cannot shut down.

Sorry my wording worried you! ;-)

Some depressing info ...

I spent weeks and hundreds of lines of code (for each attempt) figuring out the best way to add this feature. It had: user defined console size, font changes anywhere (and wrap round correctly if desired), attribute changes anywhere, foreground and background colour changes anywhere, and the whole lot was overlayed onto a standard Gem OBJECT tree where the console was defined to be the area covered by one of the objects in the tree. As any object could have a console it was possible to have multiple consoles per tree. I got to the stage where I was ready to write the final version, combine all these features together and add it into Pug - which would have meant the object tree was automatically windowed and was active (ie buttons would work etc) as well. The consoles would have been used via a printf() type function call to pug using escape codes to implement the features.

I asked for Lattice and PureC techies in order to iron out any problems of those compilers calling Mwc object code. I got zero responses, so no release could be made. One night I binned the console code in disgust.

... told you it was depressing.

I can't recall what my problem was but I do remember having one with
objc_change() so now I always use objc_draw(). In fact, as all my
forms are windowed and can be active in the background I actually
perform a proper redraw.

Now that I think about it, the problem I had might have been that
objc_change could select something but not _always_ unselect it. Can't
be sure after all this time though.

: there a key value passed to objc_edit, so I get the the itchy feeling

Erm... Look again:

short Xdial_ParseKeybd (XDIAL *dial, short key, short ctrl)

This function is called from an event loop, with key and ctrl containing the
values for the key pressed and the control keys. After some checking, the
key value is passed to objc_edit:

objc_edit (dial->tree, dial->obj_edit, key, &dial->edit_pos, EDCHAR);

: that you're not in an evnt_multi() loop. You do realize, I hope, you
: have to be in an evnt_multi() loop and call objc_edit() for each
: keyboard event?

Hence the function name ParseKeybd ...

...
>Are the lines double spaced? Might be a "single pixel" problem. If

No, there's far more space than that between them. I'd say at least ten
lines worth. At least for CAB, I also think that some text is actually
missing completely.

>Gut feeling on my part is some sort of character cell issue but there
>are 101 ways that could arise.

On the tests I've done, fVDI and NVDI have reported the same size for
characters and strings. I guess it still _must_ be something like that,
though.

>Likely. The interaction between vqt_extent and vqt_font_info can be
>quite complex for instance, especially when using "special effects".

fVDI currently doesn't support any text effects.

>>If anyone has any ideas about what might be going wrong (or have some
>>similar program (doing 'advanced' text output)
>
>Can you be more specific about what 'advanced' text output consists

Well, that would be whatever it is that CAB and AtariWorks does which
isn't done by ordinary text editors. ;-)
From what I've seen of Papyrus (old version), that program doesn't seem to
have any problems either, but I suspect it only uses the VDI to blit things
it draws in internal buffers.

Perhaps the programs set/check font sizes in some strange way. They
certainly use varying alignments and justification.
I don't see why any of that should be a problem, but something must be.

>If you can describe the attributes of the problem line(s) well enough
>then perhaps I could cobble together a small program to send to you -

All lines exhibit this problem. It doesn't matter if they are drawn in
proportional fonts or not and neither does size matter.

If you have CAB (I found the problem with a demo version) or AtariWorks
it's easy enough to test it yourself. Just download the normal fVDI v0.84
archive (for information on how to set it up) and the new fvdi_85c.lzh
(only via ftp from my site in /pub/Other) and
- create an fvdi.sys file (normally on c:)
- put 1_plane.sys (the monochrome driver) in the same directory as your fonts
(usually mentioned via the PATH variable in fvdi.sys)
- switch to a monochrome graphics mode
- run fvdi.prg
(note that current fvdi versions _can't_ run in the autofolder)
Everything should now look just about as it used to, but fVDI will be
running instead of the previous VDI.
Things to check for to make sure its really fVDI:
- A small font is used for the menu and a few other things (for a while)
- XOR mode only works for lines that are vertical or horizontal
- There are no line patterns
- No text effects are available
If you were running the standard VDI before, things should also be a lot
quicker.

>hopefully it will "screw" up as well. The bug should then be pretty
>easily located as you'll be able to use a debugger on fVDI whilst
>following my source code.

I don't even need source code as long as the cause and the effect are
reasonably close. Unfortunately, that doesn't seem to be the case with
the programs I mentioned.

: It SHOULD but it does not ! The fact is that the MiNT's memory
: protection si lame, and it doesn't protect a lot ! If you have a NULL
: pointer problem, try to look at YOUR program first.

Well, it's all solved now. Still, I don't think a NULL pointer (if that was
really the problem) should crash my Mint for several reasons :

* Mint does not seem to use logical address spaces (for compatibility I
guess), so a NULL pointer is almost always out-of-bounds, thus should
generate a Bus error, segment violation or whatever.
* Address 0 lies within the 2048 'supervisor bytes' and therefore should
generate a Bus error, whether under Mint or SingleTOS or any 680x0 system.

Greetings Atarians!

I made some adjustments to an example program for window-handling
(which I found at some ICTARI issue) so that it can show the
content that I want in GEM-windows.

My problem is that it throughs a zillion of bombs at me when I try to
run the compiled program, although it runs OK when run from the editor.

I guess that it can be caused by a lot of things, but if someone has
even the faintest idea what do look out for, please let me know!

thanks in advance! /Joakim

It may be, but the thing to watch out for is what peek and poke
actually do. They may result in multiple accesses and thus have side
effects! A tiny bit of assembler would be safer.

>(well, AtariWorks is usually OK with a file that has just been loaded,
> but as soon as I try to change anything, things break down).

Are the lines double spaced? Might be a "single pixel" problem. If
perhaps, fVDI is returning info where it is a single pixel out it
could be causing those programs to insert blank lines.

Gut feeling on my part is some sort of character cell issue but there
are 101 ways that could arise.

>I'm pretty sure I've got all the normal character and string size
>functions right (after all, no other program I've tried exhibits these
>strange problems), but perhaps there's something I might have missed?

Likely. The interaction between vqt_extent and vqt_font_info can be
quite complex for instance, especially when using "special effects".

>Strange as it may sound, I have very little previous experience with
>the VDI.
>If anyone has any ideas about what might be going wrong (or have some

Can you be more specific about what 'advanced' text output consists
of?

>and would be willing to
>test it with fVDI), please let me know.

If you can describe the attributes of the problem line(s) well enough
then perhaps I could cobble together a small program to send to you -
hopefully it will "screw" up as well. The bug should then be pretty
easily located as you'll be able to use a debugger on fVDI whilst
following my source code.

Hmm, considering Leviens

> Indeed. So it should do just fine...

apparently this is what he asked for. To me however it clearly looked as if
he wanted the (due to the ALT key) *modified* ASCII code of the key. The
concept of "*the* ASCII code for a key" is not defined, since already pressing
the shift key makes "the" ASCII code become entirely different. Both values
can be obtained by looking up the tables returned by Keytbl(). However pressing
ALT makes the code become different again for many keys, and this new value
cannot be obtained from these BIOS tables. This is all what I pointed out,
since for me it was clear that it was that what Levien asked for.

Cheers Peter

What exactly were you hoping for? I use Heat'n'Serve C because it works
well, and it's freeware. Also because it's based on the Alcyon C from the
Atari devkit it is nicely compatible with all the code examples I find
in the old programming books.
I also use the object linker for linking my DEVPAC v2 assembly code while
I'm studying a book called "Compute!'s Atari ST Machine Language Programmin
Guide". The code examples make external calls to the Alcyon object
libraries, and DEVPAC v2 lacks a DRI object file format compatible linker
and libraries.

1697. Programming the serial port : I'm looking for asm routines

Newsgroup: comp.sys.atari.programmer
Date: 1998-06-01 00:00:00 UTC
From: popov
Message-ID: <01bd923b$cf593e20$LocalHost@default>
Source record: 4310

Hello,

I realised that using the parallel port wasn't easy. So I think that I
could use the pins RTS, CTS, DSR, DTR, RI and DCD on the serial port.
I still want to program with the gfa basic, but I noticed that I can
include ASM routines with the function call.
So I'd like to know how to :
1) set and reset the pins RTS and DTR
2) get the condition of the pins CTS, DSR, RI and DCD

Now, I think (I hope ;-) that it's going to work correctly.

Thanks in advance for your answers !

Thanks everybody who have bothered to answer my questions so far.. 8)
I have now noticed that the compiled program runs fine
if I doni¿½t limit the memory with $MXXXXX.

Any ideas why it woni¿½t run it cani¿½t have access to all memory?

Thanks in advance!

Joakim Hi¿½gberg

It is the value in `key' and `key_shift' that is modified by ALT and
SHIFT etc. after a keyboard event, but I have never heard this called
the `ASCII code'. What remains constant - or should remain constant -
is key>>8. You can use that value to look up the real ASCII code in
different tables pointed to by Keytbl(), depending on the value of
key_shift. Maybe the terminology wasn't one hundred percent right, but
the idea was, to me at least, clear.

1702. United mp3 player effort?

Newsgroup: comp.sys.atari.programmer
Date: 1998-06-02 00:00:00 UTC
From: Tomas Berndtsson <tomas@nocrew.org>
Message-ID: <yz8n2bw9dcv.fsf@sara.lysator.liu.se>
Source record: 4315
Cross-posted to: comp.sys.atari.programmer,comp.sys.atari.st

Hi Atari friends!

For those of you who don't know me, I'm aka NoBrain of NoCrew. I was one of the two making the mp2 player for Falcon.

I also started a project of making an mp3 player, by converting from C sources of the amp player. This is however dropped now, for some reasons.

I've heard of a few people also working on, or thinking of making, an mp3 player for Falcon. I therefore have the suggestion of instead of some people trying at their side, we'd try to unite the effort, or at least share what we have done so far, or ideas that we have.

NoCrew has a mailing list running, nocrew-mp3@nocrew.org. This was mainly put up when I was working on the player, and has been very dead for a long time. But, it would be a good place to discuss the development of a player. You subscribe by sending a mail to nocrew-mp3-request@nocrew.org with the subject "subscribe".

Although I can't forbid anyone to join the list (well, I could :), this is what I would like it to be:

Talk about development of a possible mp3 player for Falcon.
_NO_ questions like, where can I get mp3 files, this and that song.
_NO_ mails simply asking how things are going.

I know a lot of people wants to have a player, but few are willing to try to write one. A few things that everyone might not know. An mp3 player on Falcon _will_ use the DSP, so you'd have to be able to program the DSP to make one, obviously.

Alright, this was my idea. Now, all it takes are people who want to join. :) If you know the DSP and don't have anything better to do, what are you waiting for? :)

Comments?

Sorry I didn't make clear what I really wanted. Making other apps
terminate wasn't the problem. I only want to know where on the hard disk
they can be found, so that during shutdown I can save all their names.
When booting up again I can start all apps from disk via shell_write().
The result: My system boots in just the mode I quit it.
I think 'Multistrip' does sth. alike, so it should be possible.

> on the STE but they don't sound right on the FM. Any sample converters
> that will convert PC recorded samples to work on the FM?

The STe play signed samples, most ST sample players are using
unsigned samples. (ie STe: MIN = 128, ZERO = 0, MAX = 127, and
ST: MIN= 0, ZERO = 128, MAX = 255)

To convert the sample to ST format XOR every byte value
with 128 (=0x80).

Hope this helps,

Hans

> to :
> 1) get the condition of a pin
> 2) set or reset some other pins
> I think it's feasible with peek and poke.

It is not that hard to do it with some peek and pokes,
but it is easy to blow up your printer port, and with it the
soundchip on an Atari.

The parallel port on an Atari is controlled by the soundchip
(all data lines plus strobe) and the MFP (busy). More
lines are not available on an Atari.

Bits are counted form 0-7, with 0 lsb and 7 msb

How to control them:
You have to program the soundchip. The soundchip
has two registers:

Adress Acces Name Function
$ff8800 R giread Read the selected register
W giselect Select a chip register
$ff8802 W giwrite Write the selected register

Relevant registers:
7: Mix control + IO port select
Bit 0: 1 = Sound A off
Bit 1: 1 = Sound B off
Bit 2: 1 = Sound C off
Bit 3: 1 = Noise A off
Bit 4: 1 = Noise B off
Bit 5: 1 = Noise C off
Bit 7: 0 = Port A on IN
1 = Port A on OUT
Bit 8: 0 = Port B on IN
1 = Port B on OUT

14: I/O Port A (used as output)
Bit 0: disk side 1=side 0
Bit 1: drive select A 0=select
Bit 2: drive select B 0=select
Bit 3: RS 232 RTS

```
Bit 4: RS 232 DTR
Bit 5: Strobe parallel port
Bit 6: P3 monitor bus
Bit 7: Not used on ST's

15: I/O Port B data lines

So to set data on the printer port, you have to switch
it to output (normal configuration):

reg is of type byte

poke $ff8800,7 'IO select
reg= peek($ff8800) 'read register
reg = reg OR 128 'set port on out
poke $ff8800,7 'IO select
poke $ff8802,reg 'write register

' I/O B is now on output

poke $ff8800,15 'I/O port B
poke $ff8802,192 'bit 7 and 6 are now high

Note that you have to disable the interrupts when writing
to the soundchip. System interrupts are also accessing
the soundchip.

You can get clean acces whit the OS function Giaccess (XBIOS 28)
char Giaccess(char data, WORD regno)

Return is the value of the selected register
regno: select register 0..15, add 128 for writing to the register
(-> 128..143).
data: data to write in case of write select.

The busy line can be read from the MFP:
$fffa01 R GPIP data register
bit 0: BUSY from parallel port
bit 1: RS 232 DCD
bit 2: RS 232 CTS
bit 3: GPU done
bit 4: IRQ keyboard or MIDI ACIA
bit 5: INT from FDC/ACSI bus
bit 6: RS 232 RI
bit 7: Mono monitor detect

This is in a nutshell the parallel port of tha Atari ST.

The Hisoft C Toolbox is a 'library' of windows management routines which
simplify the use of the GEM and VDI libraries, and are available without
explicit declaration. "The Hisoft C Toolbox is supplied already compiled
as a library for use with Lattice C, and can simply be linked
in." (Lattice C User Manual). The compiler finds the headers ok, but
linker reports that library routines which are in Toolbox cannot be
found. The toolbox library file is in the library folder, and I have
edited the default linker command line to tell it to include the file in
the library file list.

The problem is that even a "fast" CPU as 32MHz 030 is too slow for mp3 decoding. The FPU surely helps a lot, but still not enough to be able to do it in realtime. There are some ways to make the decoder much fast, if the quality of the sound is reduce significally.

Although optimization for CPU/FPU and DSP assembler are quite different, you're probably right in that development of both can take advantage from each other. You're free to try ;)

The Amiga has several mp3-players, a few of them even works in
real-time on 14MHz 020. Sure, the sound-quality isn't the best, but
I'm sure that one of these players can be converted to a 030-Atari.
Not that I want to do it... ;-)

I would not mind to try, but I do not know anything about mp3 on the
technical level. Also I almost only program in C. I have done a little
bit assembler, but that has been in the far past. And the floating
point processor I have never used. (Maybe some programs, but I
understand most programs do not use it.) But if you think it would be
possible for me to contribute to the Atari community. I would be glad
to keep the Atari a little more interesting to the userbase.

IMHO I would for starters also be very glad to have a (slow) mp3
encoder/decoder for atari (falcon) so at least it is possible to
exchange files with various resources :)
decode them offline and play them as wav of aif or avr or whatever.

Couldn't that be a starting point? (instead of directly going all the
DSP way)

The Fraunhofer decoder routines I compiled on Falcon have not ever
worked yet...
lots of sync problems.

And why don't you begin with a _real time_ MP2 player for falcon (or TT), and then a MP3->MP2 translator, not real time (because of lack of speed). The only MP2 players I saw for falcon are only C ports of PC sources : takes 10 minutes to

decode 1 minute of music !
That would interest me.

Eric

There is a realtime MP2 player for the Falcon! Uses DSP! Made by NoCrew or
whatever they're called!
A MP3-MP2 translator would really be great!

Cheers!

/Peter

Hi

> And why don't you begin with a _real time_ MP2 player for falcon (or TT), and

Well, it already exists for the Falcon [see NoBrain's original post].

> then a MP3->MP2 translator, not real time (because of lack of speed). The only

That will be extremely slow... MP3 encoding is very slow, and I'm pretty sure
that MP2 encoding is of a similar speed... whether you can take a short-cut
because its already in MP3, I dont know...

> MP2 players I saw for falcon are only C ports of PC sources : takes 10 minutes to
> decode 1 minute of music !
> *That* would interest me.

Look again then.... NoCrew pages...

Okay folks, issues 20-37 of ICTARI are not on the regular ICTARI page, and they're not yet on the FTP sites, but can now be found at:

http://www.geocities.com/SiliconValley/Hills/3271/

There is also a link to this from the main ICTARI site:

http://www.elis.demon.co.uk/ictari/ictari.htm

For those that *still* don't know, ICTARI is/was the disk-zine devoted to programing Atari machines. If I ever get enough interest or contributions, then I shall try to do another one. In the meantime, there are now 52 disks worth of programming information out on the 'net. -Just put it to good use. One day there might be a complete HTML table of contents and index.

If you are going to distribute ICTARI via your PD library or user group, please give the snail contact address. If you want to link this site, please get the URL right. If you do there's a chance ICTARI could be a going concern again.

Enjoy Theeself,
"Augeas"

Like most C compiler suppliers, HiSoft only supplies
enough information with Lattice C to permit those who
already know how to use the library use the library.

Now if they had a companion tutorial, like the HiSoft
BASIC package, the system would be MUCH more user
friendly.

The only thing to watch out for is attempting to write to the cartridge space -- that causes a bus error. The cartridge port is read only.

No, not really. I don't know much about encoding, more than that it's
a very complex algorhitm andtakes quite a lot memory and time. The
very last part of the decoding is the same for MP2 as for MP3, but all
before is different in several ways. So, a translator would pretty
much be an MP3 decoding followed by an MP2 encoding. IMHO, it wouldn't
be worth the effort.

Yeah, its unlikely that a stock TT could decode a full 128kbs mp3, but I'd
still like to hear from someone who's actually* tried* how it manages on
low bitrates, ones suitable for streaming audio. (wink wink :) Say, 8kbps
which is the lowest l3enc will go...

In theory, mpg123 should compile no problem on a Linux-68k system. Hacking
it for MiNT/TOS can't be that hard... :) I wish I could try it myself...

Yeah, forget realtime for now. I see no reason why a plain ST couldn't
decode an MP3 given the proper software and enough time... ;)

Ack, gotta get my MegaST4 back from my dad... Otherwise I have to make do
with a 1mb 520STfm, I doubt SozobonX is gonna like the mpg123 source... :)

>Couldn't that be a starting point? (instead of directly going all the
>DSP way)

I would think one of the existing Unix players (mpg123!) would be trivial
to get running under Linux-68k, (I say again :) as a starting point. Then
you could move on to a MiNT port, and then plain TOS... Now where did I put
that GCC...

I have compiled the amp player without problem in Linux/m68k, it was
what I used when I first tried to convert it into DSP code. There
should be no problem at all to make a MiNT version as well. The
mpegaudio package, with encoder and decoder, is already ported to
MiNT. AFAIK, that package also includes Layer 3.

The amp player when decoding an mp3 on my 16MHz 030 + FPU in Linux,
was about 40 times as slow as realtime.

The reason why I requested for a realtime player, is that it's slow to
convert (mp3 decoding plus mp2 encoding) and it takes up much
space. There are already ways to convert it now, for people who would
have spent a little time to compile some of the programs that are
available.

Personally, I use Linux far more than MiNT and TOS on my Falcon, and I
don't have gcc more than for Linux.

If you don't know where to find sources for Unix players, look at
http://www.mpeg3.com

About the Amiga players, I've mailed the author of one of them, and am
waiting for answer.

Maybe editing the default linker command line is not the way to go.
List the toolbox.lib file (or whatever it's called) in your project
file. This is the only way I have ever gotten my own libraries to be
linked in Lattice.

1734. Partition splitter?

Newsgroup: comp.sys.atari.programmer
Date: 1998-06-05 00:00:00 UTC
From: q-funk@megacom.net
Message-ID: <CZTd1.39$tg6.861688@wagner.videotron.net>
Source record: 4341
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.programmer

Is there any utility that allows splitting a partition in half?

The idea is, you only loose data that is on the partition you split;
you don't need to repartition the whole hard-disk and reinstall every
application on every partition.

I know the DOS market has such a utility, but I would need the same
for my Atari. Either a GEM/TOS program or a MiNT port of some Unix
utility is perfectly fine for me.

Please Cc your reply to my e-mail, if you have a positive answer.
Thanks.

Silly me. When you said "parallel port" I was thinking "cartridge
port"!!!

I've not programmed the printer port myself but according to the
Compendium it uses port B of the Programmable Sound Generator (PSG)
which is a Yamaha (YM-2149) chip which is accessed via two locations
at $FF8800 and $FF8802. The Strobe line is bit5 of port A on the PSG.

The BUSY signal is attached to the Multi Function Processor (MFP) chip
which is an MK68901. It's bit0 of the Active Edge Register (AER).

The are two XBIOS calls which set and clear bits in port A of the PSG,
Ongibit() and Offgibit(). The xbios call Mfpint() defines an interrupt
handler for the MFP. The xbios functions Jenabint() and Jdisint()
enable and disable the interrupt. I've never used any of these OS
calls either.

If you mess with the ports directly or need to change the processor
interrupt level then you'll need to have it running in supervisor
mode. There is a call for this also, called Super().

Hopefully someone else will see this and correct any mistakes I may
have made, or even better, post some example code which reads and
writes the port!

All that lot is in the 68901. It starts at [um I've forgotten, $FFFA01
iirc].

> Now, I think (I hope ;-) that it's going to work correctly.
>
> Thanks in advance for your answers !

How about the cartridge port? That just starts at $FA0000 and ends at
$FBFFFF inclusive. Does anybody know of a reason why that wouldn't
work? The only thing I can think of offhand is to avoid accidentally
making the ST think there's a real diagnostic or application cartridge
in there?

If the library is supplied with Lattice it would make sense for Hisoft to have included an example?

>The compiler finds the headers ok, but >linker reports that library routines which are in Toolbox cannot be >found. The toolbox library file is in the library folder, and I have >edited the default linker command line to tell it to include the file in >the library file list.

If there's an example then I'd be surprised if it didn't include a project file. This would be much more preferable than editing the default project file. From what I've heard Lattice has a myriad of options. For instance, it is convention for C functions to have a leading underscrore prepended to their names within the object libraries. There are sometimes options for discarding this automatic conversion and for implementing all sorts of other possibilities, all dependant upon the compiler. Support for foreign languages is not unusual. An option for linking object code written in Pascal would typically require the compiler to convert all your function names to uppercase and plonk the @ symbol in front of each.

I'm certain this is just a linker configuration problem. Locating an HC project file would solve this.

I get the idea.

You might get away with using shel_read and modifying the global array
to fool the Aes into thinking it is the original app which made the
call. shel_read is a bit idiosyncratic though!

The other possibility is to perform a simple Dgetdrv()+Dgetpath()
whilst whilst using the process id of each of the apps. As you're
shutting down you might get away with hacking p_run.

>I think 'Multistrip' does sth. alike, so it should be possible.

Dunno what Multistrip is. :-)

This is related to the memory leak problem below. In a standard ST
display: draw off the right edge and it'll just corrupt the left edge.
This is easy to see. Draw off the top or bottom and things will
usually go pear-shaped.

>My problem is that it throughs a zillion of bombs at me when I try to
>run the compiled program, although it runs OK when run from the editor.

Zillians of bombs result typically result from multiple processor
exceptions, the cause of which will be corruption of your compiled
code, causing the processor to jump somewhere stupid.

>I guess that it can be caused by a lot of things, but if someone has
>even the faintest idea what do look out for, please let me know!

Sometimes memory leaks go undetected when editing because they just so
happen to be corrupting part of the editor/compilation-environment
which doesn't happen to be critical at the time. It happens more often
than you would think.

If they supply a non standard library then they're going to have to say which Lattice options are required to use it. If the library were standard it would link would it not?

In any case there must be a 'librarian' - some utility equivilent to such command line tools as 'ar' (which manages object libraries amongst other things) or 'nm' which prints out the symbol table for a given object file. This would detail the exact names used in the HC library. ;-)

The docoder should be possible, the Fraunhofer IIS (the developer of the format) says the code is available for variuos processors, also for Motorola DSP56000 family, so the Falcon could do a good job. The encoder could be a problem, because even my P200MMX needs about 5-10 times the length of the input wave to encode it. An Atari is about 50-100 times slower, you know what that means...

Diamond Edge has a function in the 'Partition' section which allows
you to 'Write partition Info Only'. I think this is principally there
to allow mending of damaged boot sectors but it should do the job you
want if you are careful with the arithmetic. It would probably be a
good idea to 'Zero' the two new partitions afterwards so that their
FATs are sanitary.

I'm currently looking for another copy of STOS (boxed with manual) and a copy of
the Game Maker's Manual.

I had both at one time but sold 'em when I sold the ST. I now find that I need 'em.

Alternatively, if there's anyone in the UK who'd be willing to lend 'em to me for a
couple of weeks then I'll refund the postage. I've started work on a STOS-like
language for the PC and need to see how STOS banks and modules are structured
so that I can build-in a bit of compatability.

Hi Popov,

> And I would like to know what is the adress of the parallel port on
> an atari st ?

Okay the parallel port is accessed by means of the sound chip. This is
located at the following addresses:

$FF8800 Register Select/Read Data
$FF8802 Write Data

The parallel port is connected to registers 14 and 15. The important part
of
register 14 is bit 5, this is the strobe. Register 15 is where you put the
actual 8 bit data.

To send data:

Do
Select register 15
Write byte
Select register 14
Strobe
Delay
Repeat Until all characters are sent

Also bit 0 of the GPIP on the ST-MFP is used to indicate readiness to send.
This is addressed to $fffa01. You should note that although the port is
bi-directional there is no hardware method to indicate that a new byte is
ready to be recieved. I can't remember where the switch to change direction
is located.

John.

>
>I haven't had any success at all in finding either version. :-(

The first one is (only, but I could copy it if necessary) available via
the fVDI WWW page, which you can find a link to from my top page at:
http://rand.thn.htu.se

>Could you give the complete path to each please.

I can't give you a more complete path than what I did, since that's all
there is to it. If you're using a Web browser to do ftp, you should try:
ftp://rand.thn.htu.se/pub/Other/
Among other things you'll find the file mentioned (fvdi_85c.lzh) there.

Actually, fvdi_85d.lzh is the latest right now and fvdi_85e.lzh will
most likely be uploaded tomorrow.

If you still can't find it (which is very strange since several people
have already downloaded it), email me and I'll send it to you. It's
less than 30kbyte, so that shouldn't be a problem.

Version 0.85e is actually quite nice even in 16 colour mode on my machine.
All solid blits seem to work fine now (all blits are currently done as
solid) and solid fills work as they should. There's still no real text
acceleration (should be faster than the standard VDI, though) and all
text and other mono-expand blits, as well as patterned fills) are black
and white only.
On my AB040, this version (when the shadow buffer is turned on and the
cache operates in copyback mode) is between 50% and 200% of NVDI's speed.
The slowest numbers are for text drawing and the fastest for blitting.
Since the monochrome version is very close to NVDI on text drawing (and
actually up to five times faster for small text), I expect the 4 bit
driver to be as well once the real text acceleration is kicked in. :-)
(The shadow buffer is a copy of the screen which is kept in FastRAM.
That way no reads need to be done from the real screen in slow ST-RAM.
Without an '040, the shadow buffer is probably not a good idea.)

: Is there any utility that allows splitting a partition in half?

Er, not as such, AFAIK...

: The idea is, you only loose data that is on the partition you split;
: you don't need to repartition the whole hard-disk and reinstall every
: application on every partition.

It shouldn't be _too_ hard to write... You'd just need some info on the
structure of the partition table and rootsector (can be found in the
linux-68k sources, in one of the header files).
You'd need to change the partition info in the table, the number of
clusters, FAT size, etc. in the rootsector and -if you use a FAT filesystem-
the FAT sectors themselves...

: I know the DOS market has such a utility, but I would need the same
: for my Atari. Either a GEM/TOS program or a MiNT port of some Unix
: utility is perfectly fine for me.

The problem is that nearly every system has its own parttion table format...
(although the DOS and TOS ones are fairly similar, IIRC)

Easy stuff. The address lines are output lines even at the cartridge
port. So a

```
lea $fa0000, a0
tst.b (a0, d0)
```

outputs the lower 16 bit of D0 to the cartridge port. The AS line, ORed with
one of the two select lines at the cartridge port, can be used to tell some
register at the port to latch the data appearing at the address lines.

Bugs in the GFA libraries. GFA is well known to cause bad code, i.e.
ignoring many of Ataris specs, therefore causing trouble all over the
place with modern systems.

Easy, just use the address lines as data-out lines. Of course this makes it
hard to read (or write...) to more than one address, think of it as a high
speed parallel-ish port...

It must be possible- there's a read/write parallel port adaptor which
runs in the cartridge port, and it certainly supports writing to ZIP
drives.

1759. Problem with VA_START command line

Newsgroup: comp.sys.atari.programmer
Date: 1998-06-07 00:00:00 UTC
From: frederic.dinh@hol.fr
Message-ID: <6le85j$i9e$1@news4.isdnet.net>
Source record: 4272

Hello all,

I'm implementing VA_START in one of my programs, and I've got some problems.
The command line passed via VA_START is displayed in the info line of the
window (it's a window form). I use Pure C.

Sometimes the line is perfectly readable, sometimes not (melt of low ascii
caracters or a string somewhere in memory but surely not a filename) so my
'load a file' routine fails.

To get this string, I do the following :

```
int mesag[8]; /* the event buffer */
long pointer; /* a pointer for the string */
...
pointer = ( (long) mesag[3]<<16 ) + mesag[4];
wind_set (id, WF_INFO, pointer);
```

(I tried a char * pointer but apparently it didn't change anything except more
curious strings !!).

Sometimes I also get Magic hangs (system stack overflow, the system will stop)
when I drop files onto my prog desk icon (not talking about drag n'drop).
I don't have any idea of the cause. I free all the buffers I don't need but it
makes system stops.
Can somebody give me clues ?
Thanks a lot.

1760. How can I recognize ascii files from binary ?

Newsgroup: comp.sys.atari.programmer
Date: 1998-06-07 00:00:00 UTC
From: frederic.dinh@hol.fr
Message-ID: <6le863$i9e$2@news4.isdnet.net>
Source record: 4273

Hello all,

I'd like to know how to make a difference between ascii and binary files so my printing program won't load binary files.

Do you think scanning some bytes, say 64, at the beginning of the file should be reliable ? Can I say that, if i find an ascii caracter <32, it is a binary file ?

How did you partition your hard drive?

I believe if you have ICD Pro or an ICD host, it's a simple matter of using ICDFMT to go in and redefine your partitions. Use the setting to only write the info for the old partition and the new one you create, though, because you could repartition the whole drive by mistake.

Hi

Some characters will be less the 32 as these can be CR and FF
(carriage return & form feed) along with possibly other control
characters.

I do believe there is a program that can help determine what the file
is, I can't recall the title off-hand.
Cheers! for now
Steve

Hello,

I am wondering if I could use my ATARI 1040STE as gateway for my Atari
8-bit computer.

What I mean is that I want to connect to my internet provider with my
STE and then run all other software from my Atari 8-bit with a
terminal or something like that. The STE (only) has to keep the
Slip/ppp connection going...

I want this because this way I can probably connect my 8-bit BBS to my
e-mail box at my provider and automaticly import/export it to the
internet.

Is there somebody who has made such a link in the past ???

Gtx,
Sysop*TXG -= The Underground Node #472 BBS =-

Running BBS Pro! V5.0b on ATARI 130XE with Black-box 140Mb scsi drive
and 28K8 Us robotics sportster...

> was. :-)

It is read only, although there is a way to make it so you can read/write
a 64Kb block. I can't remember where I got it, but I've a small (~8Kb)
archive that contains the construction info for such an interface. The only
problem with it, is it needs a PAL to work.

> >-- George Crissman

There isn't a write line and trying to write to it gets a bus error. Not
sure who generates it, probably the glue chip.

Rene de Bie (SysopTXG@underground.demon.nl) scribbled:
: I am wondering if I could use my ATARI 1040STE as gateway for my Atari
: 8-bit computer.
:
: What I mean is that I want to connect to my internet provider with my
: STE and then run all other software from my Atari 8-bit with a
: terminal or something like that. The STE (only) has to keep the
: Slip/ppp connection going...

If you install MintNet on your STE (may be a problem for memory), then
you can dial-in (by modem or directly by null-modem) to your STE with a
terminal program on your 8bit box. The STE will need pppd and mgetty or
getty for that purpose. BTW, a potential problem is the fact that the
STE has only 1 serial port, so how do you want to connect *both* modem
and 8bit Atari ?

: I want this because this way I can probably connect my 8-bit BBS to my
: e-mail box at my provider and automaticly import/export it to the
: internet.

Hmm, don't know if that will be easy. I have little experience with BBSs.

: Is there somebody who has made such a link in the past ???

Well, I have set up a small Atari-only Intranet (TCP/IP based) a while
ago. It had one Falcon as server, and two other Atari's as clients. It
supported FTP, HTTP, etc. If you have any questions on that, just reply
to this post.

1766. Timer A

Newsgroup: comp.sys.atari.programmer
Date: 1998-06-07 00:00:00 UTC
From: David Knight <david@ritter.demon.co.uk>
Message-ID: <emx1vsbm.fsf@ritter.demon.co.uk>
Source record: 4279

Could anyone help me with the following?

I'm attempting to write a D2D playback routine which doesn't seem to work.
I've included part of the code (asm) below.
The first part of the buffer plays and the interrupt does occur, but the
second half of the buffer doesn't play.

As a test I changed the timer I was using to Timer B, which did play
all the sample, but had the expected result of playing it all extremely fast
and also crashing the machine. Well I think it played it all, no real way
of telling other than the disk activity.

The program is executing an evnt_multi() loop check a flag (called d2dNext)
which is set by the interrupt routine. When this is 1 the code for playing
and loading the next parts of the sample is executed.

David

There isn't one-way : here's some hints.
- If the file begins with $601A, it's a gemdos executable.
- If there is zeros (bytes), should not be a text (same for weird <32 chars :
1-8, 11, 14-26, 28-31)
- If there is many cr/lf chars (13,10), it's _probably_ a text. (same for
spaces=32)
You can define yourself some heuristics ...

(oui, c'est encore moi ;-)
Eric

> wind_set (id, WF_INFO, pointer);

Make sure you calculate with unsigned values here, or limit them to 16
bits. 'int' is signed, so if mesag[4] happens to be >= 0x8000, it's a
negative value and you won't get the correct result. Better use something
like this:

pointer = ((long)mesag[3] << 16L) + ((long)mesag[4]) & 0xffffL);

Ciao

You find a pointer to act_pd in the TOS header. If you need more
information, I can look it up for you.

Ciao

Tu ferais de toute fa�on nettement mieux d'utiliser un char * : c'est bien plus propre.

La fa�on la plus simple d'�viter des probl�mes douteux avec des trucs
aussi peu propres (convertir 2 ints en en char *, c'est la porte ouverte aux
ennuis...), le mieux est de profiter des unions :

```
typedef union
{
int type; /* Le type du message : toujours le premier int des 8 */
int general[8]; /* Message g�n�rique : 8 int */
struct
{
int entier_1, entier_2, entier_3; /* Oubli� le sens, mais bon :-) */
char *chaine;
/* Et la suite */
} message_va;
} Message;

Message truc;

evnt_multi(MU_MESG, ..., &(truc.general), ...);

switch (truc.type)
{
case ...
...

case VA_START:

chaine = truc.message_va.chaine;
printf("Chaine transmise : %s\n", chaine);
```

```
...
}
```

C'est plus lourd, mais au moins on est s�r que �a marche...

Plus l�ger, mais moins propre (mais alors, franchement moins...) :

```
char *chaine;
int message[8];

chaine = *( (char **) (message + 3) );

I think it's called 'WHATIS', or similar. It's hidden somewhere on one of
the ST Format or ST User coverdiscs. Not sure which one it is... Right,
version 6.7 is on the ST Format coverdisc 74, and is 16.5Kb long. It's
presently an accessory, although it works as a application as well. It works
under Magic, but it's not too good at recognising some types of files. It
thinks that GFA basic and resource files are Tiny format pictures.

From: Lars.Froehlich@t-online.de
Message-ID: <6lhch3prf1@news00.btx.dtag.de>
Source record: 4287

```
Hi Terence!

>Is there an easy way to redirect the output to the console (STDOUT)
>to a file under TOS when programming in C?

Just use GEMDOS Fforce(1, handle) to redirect stdout to a file you opened
using Fopen. For example, the following redirects stdout to "output.txt".

{
long handle;

handle = Fopen("output.txt",1);
Fforce(1,(word)handle);
puts("This goes to output.txt");
Fforce(1,1);
Fclose((word)handle);
}

Hope that helps,
Lars

Greetings,

I am an "old" Atari owner how has just recently returned to this wounderful platform. For a while now I have been programming C++ on the PC, but now I would like to use it on my Atari. Is there a C++ compiler for the Atari? I have heard of Gnu C++ being ported to Atari, but I don't know what files I need for it. Help? Is it possible to program GEM under gcc? Please help me start to program for the Atari again!

Shine on you crazy diamond(s)

/Tobias

Bonsoir,

Quelques explications (en fran&#65533;ais parce que c'est du C pas de l'atari
alors :-), qui j'esp&#65533;re seront plus simples.

Dans l'article <6lhir6fho3@news4.isdnet.net>,
Frederic Dinh, <frederic.dinh@hol.fr> a &#65533;crit :

>> La fa&#65533;on la plus simple d'&#65533;viter des probl&#65533;mes douteux avec des trucs
>> aussi peu propres (convertir 2 ints en en char *, c'est la porte ouverte aux
>> ennuis...), le mieux est de profiter des unions :
>
>D&#65533;j&#65533;, ca s'annonce chaud... j'ai jamais utilis&#65533; les unions...

En deux mots&#65533;:
- une union est une fa&#65533;on propre de d&#65533;clarer quelque chose dont le type est
variable. Exemple type sous GEM : le champ ob_spec des objets. Classiquement,
on dit que c'est un long et on fait ensuite des bidouilles. En fait, l'id&#65533;al
serait de dire que c'est _&#65533; la fois_ un long, un char *, un TEDINFO *,
un... Chance, &#65533;a se fait en C avec le union. Ce serait donc&#65533;:

```
union
{
long divers;
TEDINFO *tedinfo;
ICONBLK *icone;
char *texte;
...
} ob_spec;
```

Dans ce cas, si tu utilises ob_spec.divers, il sait que c'est un
long&#65533; si tu utilises ob_spec.texte, il sait que c'est un pointeur sur une
cha&#65533;ne&#65533; ainsi de suite.
La syntaxe d'utilisation est exactement celle d'une structure apr&#65533;s&#65533;:

ob_spec.divers indique l'&#65533;l&#65533;ment divers de l'union.

Ce qu'il faut savoir (c'est ce qui le rend tr&#65533;s pratique)&#65533;:
- la taille r&#65533;ellement occup&#65533;e est celle de l'objet le plus gros de l'union&#65533;;
- les donn&#65533;es sont mises dedans &#65533; en vrac&#65533;&#65533; et donc leur nature ne d&#65533;pend que
de l'objet que tu appelles. Exemple : si tu fais
ob_spec.tedinfo = NULL;
printf("%f\n", ob_spec.divers + 2);
printf("%p\n", ob_spec.tedinfo + 2);

Tu auras en sortie :
2 (= 2L + 0L)
2*sizeof(TEDINFO) (= NULL + (TEDINFO *) 2) = 56 si ma m moire est bonne
et en m moire, l'adresse &(ob_spec) : 0x00000000

Est-ce que le r le de l'union est plus clair maintenant ?
(Le gros avantage : contrairement au cast brutal (char *) depuis un
long, a ne suppose pas que sizeof(char *) = sizeof(long), ce qui marche sur
l'atari mais est d'une portabilit douteuse... [tu me diras, avec le GEM... Je
dirais : m fiance si tu veux utiliser, par exemple, la lib X/GEM que je
d veloppe :-)]

><gonna be hot... never used unions before...>
>
>> typedef union
>> {
>> int type; /* Le type du message : toujours le premier int des 8 */
>> int general[8]; /* Message g n rique : 8 int */
>> struct
>> {
>> int entier_1, entier_2, entier_3; /* Oubli le sens, mais bon :-) */
>> char *chaine;
>> /* Et la suite */
>> } message_va;
>> } Message;
>
>Arrgh ! Trop fort !

Donc l , le type Message est _ la fois_
1) un entier : champ type
2) un tableau de 8 entiers : champ general
3) une structure contenant 3 entiers puis un pointeur de cha ne (il faudrait
les 3 entiers manquant pour bien faire...)

Si en m moire tu as un truc du genre
0x0001 = Message.type = Message.general[0] = Message.message_va.entier_1
0x0002 = 1 = Message.message_va.entier_2
0x0003 = 2 = 3
0x0004 = 3 } = Message.message_va.chaine
0x0005 = 4 }
0x0006 = 5
0x0007 = 6
0x0008 = 7

>C'est b ! M me si j'ai du mal suivre ! Les entiers entier_x servent
>"aligner" chaine sur le 4 me mot du tableau (mon mesag[3], quoi), c'est a ?

```
Oui. En fait, entier_1 = message[0],...
```

>> C'est plus lourd, mais au moins on est s r que a marche...
>> Plus l ger, mais moins propre (mais alors, franchement moins...) :
>> char *chaine;

>> int message[8];
>> chaine = *((char **) (message + 3));
>
>Te moques pas, j'ai d�croch� - et dire que c'est plus l�g� ! Je vais passer un
>peu de temps � piger l'indirection (c'est bien �a non ?) et je reviendrai...

message[] est un tableau d'int donc message + 3 = &(message[3])�; on
fait croire au compilo que l'adresse de message[3] est en fait un pointeur sur
une cha�ne (char *), et on prend la valeur de ce pointeur de cha�ne (*(...)).

IIRC, True ASCII is a 7-bit code (0-127), which means
you won't find any byte-sized values larger than 128
anywhere in the file.

Actually, it's owned by the AES itself, but the end result is pretty much
the same. Trivial, I know! :-)

Not at all reliable for any other language than English... As I don't
want any program to reject my French texts only because I use accents (all
coded after 128), please FORGET THAT RULE...
Even if, in fact, pure original ASCII defines only codes on
7-bit... That's history now. Present is ISO codings (8 bits or more...).

>Can somebody give me clues ?

Imagine mesag[4] is $8765 and mesag[3] is $4321. The result you are
after is $43218765 but this is what really happens:

mesag[3] is promoted from signed int to signed long, so $4321 becomes
$00004321. It is then shifted left 16 bits to become $43210000. Okay
so far (but technically incorrect).

As the compiler has promoted one argument to signed long it is obliged
to do so with the other arguments. In this case mesag[4] is promoted
from signed int to signed long so $8765 becomes $FFFF8765. Finally,
this is added to $43210000 giving a result of $43208765.

The answer is to use unsigned math when manipulating pointers. It is
also more usual to use bitmasking rather than addition. There are two
ways of doing this. You can declare some intermediate variables or use
the required casts.

```
/* this is a bit extreme but is legible */
int mesag[8];
uint lo_word,hi_word;
ulong lo,hi;
char *pointer;

hi_word = mesag[3];
lo_word = mesag[4];
lo = lo_word;
hi = hi_word;
pointer = (char*)(hi | lo);
```

whereas casting would require this

```
int mesag[8];
char *pointer;

pointer = (char*)(
(((ulong)(uint)mesag[3]) << 16) |
((ulong)(uint)mesag[4])
);
```

which can be simplified of course.

On another matter. There is an undocumented limit on how long the string can be for a window name (WF_NAME) under MagiC. This may apply to the WF_INFO line also. Thus it is wise to manually truncate the line with a nul should it exceed (roughly) 200 chars.

Unfortunately no. There isn't a method which is 100% reliable. Any
given file could contain any value in the range 0->255 and still be a
valid text file, or vice-versa.

>That holds the Process Descriptor of the current Programm.

Another name for this variable is p_run and although you can mess with
it you shouldn't because it is documented read-only.

>Where do I find this variable?

You might not need it. It is true that an acc using Malloc causes the
memory obtained to be owned by the main application, thus when the
main application terminates the memory is lost. However, memory
allocated before the first AES call made by the acc *is* owned by the
acc. Therefore, if you are able to determine your memory requirements
before appl_init() in effect, you don't need to fiddle with p_run.

Additionally, such operating systems as MagiC don't suffer from this
problem - and the accessory is best executed as a normal process in
any case. You should be safe interrogating the entry in the global[]
array which specifies the maximum number of concurrent processes. If
it is not 1 then you are multitasking and can start a normal process.
If it is 1 then you should start as an accessory.

> pointer = (char*)(hi | lo);

Well, this won't ever work, either. pointer will still contain a
16-bit-value aftwards. For example, let mesag[3/4] be 0xaaaa and 0x5555:
pointer will be 0xffff afterwards, which sure isn't what you want.

I can't think of a (simple) way to do it without shifting in plain C.

Ciao

Thomas

eek! I did did meant to put in a shift but it looks like the bit
shifting monster came and gobbled up that line!!!

Afaik the only C++ compiler for the atari is the Gnu one. I've never
used it myself although from what I've heard most folks who use it
tend to do so from a unix environment (which is called MiNT for
machines with lower spec 680x0 processors).

I guess it would be possible to get it running under a suitable
command shell but again I've never tried. Hopefully my reply will give
rise to some more useful responses!

This is correct but there's one small point: the text file might not
be in ascii. ;-)

The easiest way, IMHO, is to do as follows:

pointer = *(char **)&mesag[3];

That is, take the address of the fourth array element and use it as a
pointer to the character pointer we want to get.

Maybe by making a connection with the parallel interface from ST, I
need some software that can emulatie the Computer serial signal, must
not be so hard because the ATARI ST XFORMER was able to read floppy's
with the parallel cable from the ATARI 8-bit 1050 drive and that runs
at the same speed as the computer that send serial data to the rs232c
interface 850. Max. 19.200 bps ASYNC....

The game is finished apart from a couple of small bits such as title screen and intro. This version of the game has been uploaded for testing purposes only. If you would like to test the game then go to http://www.users/zetnet.co.uk/sillysoftware/playtime.htm

There are five zips files to download but none of them are more than 500kb. Note, once you have downloaded the first four then you will only need to download the fifth (MAIN) when the game is updated.

Full instructions are in the file info.doc

Note: I couldn't get it to run under Pacifist v0.46 or v0.48, if anyone can please let me know.

Well, I have almost zip experience with 'The Old Ones', so I'll leave that
to the techheadz. However, it's a nice idea, and it would certainly be
great if you could use the parallel port as a serial port. What would
be fantastic, is when someone would write a Mint extension to use the
printer port as a serial device. Then all your worries should be over.

: > to this post.
:
: Now, you will see I did....

Well, here are some details : I had one regular Falcon as the server. It
has Mint 1.12 and MintNet installed with KEMD rev 2. Check out :

http://www.primenet.com/~kellis/

It ran SMTP (mail) and FTP, and NCSA httpd 1.3. I installed a huge existing
website on it, and it all worked well (clients connecting with CAB). To
connect the clients, I used SLIP connections, because PPP did not work.
The clients were : Apple Powerbook with MagicMac, MEGA ST 4, and a

boosted Falcon. All worked well, except the LAN port on the Falcon did
not work with the SLIP. Terminal connections are *no* problem. I tested
that with Connect 2.46

If you have any specific questions, fire away.

Greetz,

****
* PHENIX 040® Workstation *
* FIXED FEATURES V.1.0 <-- YEAH !! *
****

® MAY 1998, CENTEK

This computer is NOT a TOS clone or a PC compatible !
It is a NEW computer including NEW HARDWARE and NEW OPERATING SYSTEM named DOLMEN®.
A software EMULATION support into the system allows to run softwares from the old operating system named TOS®.

- MOTOROLA® MC68040® at 40 MHz (BCLK).
NOTE : The 040 instruction execution units are CLOCKED by the BCLK and NOT the PCLK (80 MHz) - See Section 10 page 10-4 of the MC68040® DATABOOK (M68040UM/AD Rev.1) and our technical files on this site !
By example : - Afterburner® is a 040 at 32 MHz !
- Hades® 040 is a 040 at 32 MHz !
- Milan® 040 is a 040 at 25 or 33 MHz.
People who present the 040 as a x2 (i.e 64 MHz) clocked processor are liars !!!
CENTEK refuses to use the same 'commercial' politic !

- Can be updated with a 060 at 80 MHz (BUS at 40 MHz).

- BUS : 32-Bit DATA / 32-Bit ADDRESS / 40 MHz Frequency.

- Three SIMM sockets : 32-Bit RAM up to 192 MB.

- MOTOROLA DSP 56301® at 80 MHz (80 MIPS !).
- 24-Bit HOST port with 3 clock cycles access :
80 MB/s DMA transfert (or 26 MWords (DSP 24-Bit words).
- On-Chip Memories : - 2048 * 24-Bit X Data RAM.
- 2048 * 24-Bit Y Data RAM.
- 3072 * 24-Bit Program RAM.
- 1024 * 24-Bit Instruction CACHE.
- 192 * 24-Bit Bootstrap ROM.
- Off-Chip Memories : 384 kB 15ns SRAM (=128 kWords 24-Bit).
- External DSP connector (Falcon signal upward compatible).
- HD SUB-D 44 pins.

- MOTOROLA MC68360 - QUICC® at 40 MHz.
(QUICC® : QUad Integrated Communications Controller).

- CPU 32 Core (68030) - 7.2 MIPS at 40 MHz.
- 32-Bit DATA and ADDRESS lines.
- Four General-Purpose 16-Bit Timers.
- Sixteen 16-Bit software Timers.
- Two Independent DMA (IDMA) with Single Address Mode
(up to 80 MB/s at 40 MHz per DMA channel).
- Communications RISC Processor (35 MIPS @ 40 MHz) with 14 DMA
channels :
- Ethernet/IEEE 802.3 Optional (Full 10-Mbps Support).
- A motherboard slot is dedicated for this option.
- 32-Bit DMA transfert.
- RS-422/GeoPort up to 4 Mbit/s full duplex.
- Mini-DIN 9 connector.
- LocalTalk and AppleTalk backwardly compatible.
- 6 kV ESD protection.
- 32-Bit DMA transfert.
- RS-232 up to 1 Mbit/s.
- Standart SUB-D9 conector.
- 15 kV ESD protection (European standart).
- 32-Bit DMA transfert.
- Full CENTRONICS IEEE 1284 parallel port.
- Up to 4 Mbit/s half duplex.
- 32-Bit DMA transfert.
- TWO MIDI (In/Out/Thru) channel.
- DIN-5 standart connectors.
- 32-Bit DMA transfert.
- One SPI channel.
- The 3 pins are on the DSP connector.
- 32-Bit DMA transfert.

- THREE 8-Bit ADC channels for external DATA acquisition.
- The pins are on the DSP connector.

- PCI controller : - MASTER and SLAVE.
- Two DMA channels (up to 132 MB/s).
- PCI 2.1 compliant.
- Support of the PCI 3.3v signaling.
- Support of the I2O new PCI messaging.
- Two PCI slots.

- USB controller for 2 HOST USB connectors :
- 32-Bit DMA transfert.
- one is used by the keyboard.
- the second is available for all the USB peripherals...

- 128 kB FLASH Eprom containing the BIOS (SET UP/AUTOTEST/BOOT).
The FLASH enables the software updates.

- ULTRA-SCSI bus (SCSI Controller with 16-Bit DMA) :
- The SCSI bus maximum rate is 20 MB/s.
- The HOST DMA maximum rate is 40 MB/s.

- VIDEO : S3 VIRGE DX with 4 MB of EDO RAM.
- This card occupies one of the two PCI slots.

- SOUND : You can choose a card between :
- Stereo 16-Bit 33/44.1/48 kHz :
- 2 CINCH Inputs / 2 CINCH Outputs
- 1 Mini-Jack for a microphone.
- 1 PC compatible GAME port
&
- Professional 24-Bit 48/96 kHz Card including :
- 8 INPUTs / 8 OUTPUTs, SPDIF®/AES®/EBU® Interface.
- 2 others MIDI channels

- VOCAL : TI® Speech Processor for the
Speech Recognition, Speech & Music Synthesis,
Access Control, and Software ONLINE HELP !
** This feature will be fixed later **

- TIME : Timekeeping® module with 242 bytes of NVRAM (Non Volatile
Ram) with RESUME mode to Wake up the PHENIX®.

- SLOTS : - Two PCI slots (one is used by the Graphic card).
- One DIRECT 040 Processor slot for Hardware expansions :
- others CPU (040/060) card.
- PowerPC® card (to mute the softwares to .....)
- others DSP 56301 card.
- VME® bus.
- Memory adding card (up to 256 new MB).
- One AUDIO slots (it is used by the Audio card).

- KEYBOARD : USB Keyboard !!
- This one may be a KEYTRONICS® Natural® keyboard.

- MOUSE : PS/2 mouse.
- it is connected to the USB® keyboard.

- CASE : Standard Middle ATX 2.0 Tower.
and CENTEK desktop case...later.

- POWER : ATX 2.0 compatible.

- OPERATING SYSTEM : DOLMEN®
- Multi-tasking
- 100 % 040 ASM code !
- AES & VDI backwardly compatible.
- The VDI uses all the 2D/3D S3 VIRGE® functions.
- Easy to update by the Flash and the HD.

****
* FINAL USERS INFORMATIONS *
****

-> The PHENIX complete configuration includes
- MOTOROLA 040 CPU (may be updated to 060)

- LS120 Drive (120 MB disks & floppy 1.44 MB compatible)
- 16 MB 32-Bit RAM.
- S3 VIRGE DX 4MB 3D Graphic card
- One 16-Bit Audio card.
- 3.2 Go ULTRA SCSI Hard Drive.
- 24x IDE CD-ROM Drive.
- USB 105 touchs NATURAL® Keyboard.
- PS/2 mouse.
- ATX Middle Tower.

PRICE : 9990 FF (French VAT included).
1380 USD (no local taxes included).

OPTIONS :
- MULTISYNC 17' 0.26 pitch monitor : + 2690 FF
- DVD-ROM® drive : + 1700 FF

-> MOTHERBOARD ALONE (with the 040) : 4990 FF
690 USD

****
* HARDWARE & SOFTWARE DEVELOPERS INFORMATIONS *
****

COMPLETE configuration : 6490 FF TTC (including French VAT).
MOTHERBOARD ALONE (with 040) : 3290 FF TTC.

These configurations include :
- CD-ROM (AND PAPER) complete Documentation (Software and Hardware
(slots)) and SYSTEM HOTLINE (Phone/E-mail) for the developers !
- CD-ROM with the developer package :
- CENTinel® The ultimate 040/060/DSP56301/68360 debugger.
- CENTasm® The 040/060/DSP56301 assembler.
- CENTedit® The universal color editor.
- FASHION® The RSC builder for DOLMEN.
- GNUC++ 040 pack.
- and the other things some developers will bring.

****
You'd like to become a PHENIX DEVELOPER ?
You will need a CONFIDENTIAL agreement !

I think the best way is to determine the ratio of the characters 10, 13,
the characters between 20-127 and the total character count, if it is
about 80% or more you can be pretty sure to have an ASCII file.

1804. Magic and long command lines

```
-----BEGIN PGP SIGNED MESSAGE-----

While writing a program to convert upper case filenames to lower case, I've
come across a problem with Magic. According to the programmer docs, Magic
supports the ARGV format for extended command lines. The trouble is, when I
do a getenv("ARGV"), I get a null pointer, although a getenv("GV") returns
the correct ARGV list. What appears to happen is the ARGV=... is turned into
A[NULL]GV=... which breaks the search.

What I want to know is, is this a fault with my installation, or is it
something wrong in Magic itself? Anyone else have a problem with this, or
even noticed it?

I'm using Sozobon C v2.0, DLibs v1.12 (with a few extras), Magic 5.11 and a
4Mb STE, just in case any of these have any bearing.

```
-----BEGIN PGP SIGNED MESSAGE-----

Anyone got any tips on how to add support for 'drag and drop' under Magic?
I've been trying for over a week to figure out how it's done, and finally
given up with the VA_? messages, as Magic doesn't use these to let my app
know about it. I've got as far as figuring out that a message ( 63 ) is
sent when a file is dropped on the window, but I don't know how to handle
it.

BTW, I've tried using the Magic 5 programmers docs, but I can't read German
and the translation makes only a little more sense.

Ah but it made me think of a question so perhaps not! ;-)

Any idea if things would still work ok if the acc set p_run to its own basepage? I've always wondered why someone hasn't dreamed up a workaround for this problem.

It works just like under MiNT. ;-)

Seriously, it's not very hard when you have figured it out. It's explained
in the compendium and probably somewhere else. I have got sources for it
right here which I got from Erik Hï¿½ll. I could mail it to you if it's
alright for Erik or you could ask him your self. He is always very helpfull.

1808. MDESK prob

Newsgroup: comp.sys.atari.programmer
Date: 1998-06-12 00:00:00 UTC
From: Katherine L Ellis <kellis@primenet.com>
Message-ID: <Pine.BSI.3.96.980612043113.29133B-100000@usr08.primenet.com>
Source record: 4221

hi magnus, I have found a bug in your MDESK it seems.
Ran from a falcon 14meg of STram and NO TTRAM. If the RAM option from
the mdesk.inf is set to TRUE (or ON whatever), it will just crash.
At first I thought it crashed because of some bug in the windowing.
but it really seems it comes from this TTRAM checking thing.
Could you take a look?
Thanks

1809. Weird problem in my code.

Newsgroup: comp.sys.atari.programmer
Date: 1998-06-12 00:00:00 UTC
From: Katherine L Ellis <kellis@primenet.com>
Message-ID: <Pine.BSI.3.96.980612043331.29133C-100000@usr08.primenet.com>
Source record: 4222

Hi, I have made this prog, has been developed under mint and made FOR
mint. however I noticed that it could be used from singletos as I
didn't access any Mint specific routine.
Well, in short, I tried it under singletos with the aes of my falcon,
it will start fine, I open it, I use it fine, but if I close it, OR
run a prog, then it is all messed up, It won't open anymore. Will use
some cpu time (like if it was running, but I can't see it running)
etc.
The weird part is That this is NOT an OS related problem, but really
an AES. As IF I load gem.sys (aes 4.1) for example, STILL under
singletos, my acc will run fine. (oh yes my prog is an acc).
If ran from MiNT and aes 4.1 or naes, it works fine.
If even ran from Magic! it will runs perfect.
SO, my question, am I hiting a bug (known?) that was in all aes <4.x ?
If, yes which one? how to avoid it?

Lemme recap quickly: The prog is an ACC.

singletos (old aes) > crash
singletos (new aes) > good
all multitasking(mint, magic) > good
didn't try under geneva, so I couldn't tell.
Thanks.

The AES will on every window redraw look at the pointers given to where
these strings are supposed to be. Therefore the addresses provided must be
longterm stable, in other words the strings must be either in a malloc
area, or in an INLINE or stored in a numerical array which is known not to
move about at runtime (i.e. DIM'ed early at startup with nothing later
deleted from "underneath it").

(I would guess that you simply passed the value V:a$.)

Yes, it works fine. That's exactly what I do in several DA's I've written.
This not only solves the problem of memory getting deallocated when the
main app quits, it also keeps file handles from being closed in the same
situation.

Just a reminder: don't do this if there is multitasking of any sort.

g > Any idea if things would still work ok if the acc set p_run to
g > its own basepage?

I've been doing that for some time now. Just remember to set it
back again.

I used to check for multitasking by comparing *p_run to the current
basepage. Later I decided that it was faster just to reset it.
While *p_run may be volatile, under any form of multitasking it will
always contain your basepage WHEN YOU ACCESS IT.

The first thing you need to do is find out what AES command is causing the crash, either using a source level debugger or by inserting form_alert()s to narrow down the bad section.

It is likely you are using an AES command not supported for early TOS versions (e.g. fsel_xinput).

Yes. WF_NAME and WF_INFO just store the pointer to the string, not the
string so never use local variables for the string.

There is also another issue which came to light not long back. It is
wise to ensure your strings do not exceed about 200 chars as this can
cause corruption also.

1818. Iconifiying from a menu item

Newsgroup: comp.sys.atari.programmer
Date: 1998-06-12 00:00:00 UTC
From: David Knight <david@ritter.demon.co.uk>
Message-ID: <btryfej2.fsf@ritter.demon.co.uk>
Source record: 4231

I while back I was asking about a way to do this subject.
I have though of a way but was wondering how "clean" the idea is.

you can find out the w and h that your window needs to be with a
wind_get() call, cant remember the number.
Using this information could you do something like,

```
for(int x=0; x<max_X ; x+=width of an iconified window)
{
if (wind_find(x,max_Y)==0)
{
x2=x;
x=max_X;
}
}
```

so that x2 will point to place to put your iconified window?
The y coord to place it at being calculated by,

```
y = max_Y - height of an iconified window
```

you then use wind_set() to iconify it to the calculated position.

I've not actually got around to testing the above so it may not even
work.

So it is enough to check global[1 iirc] (concurrent process value) in
order to determine if fiddling with p_run is necessary?

if (global[1] > 1) /* dont fiddle */
else /* fiddle */

If this is the case then I might knock up a workaround for others to
use.

Generally speaking, the older the Gem version the more sensitive it
is. Worse still, the problem has a habit of 'persisting'. By that I
mean you could have a bug in your development program which upsets Gem
slightly. You can then mess around for the rest of the day changing
the source - only to find you'd fixed it hours ago and Gem is just
mucking you about. With singletasking Gems I'd always advise a reset
between runs on a buggy prog. It's a pain but there's no other way.

>Lemme recap quickly: The prog is an ACC.
>
>singletos (old aes) > crash
>singletos (new aes) > good
>all multitasking(mint, magic) > good
>didn't try under geneva, so I couldn't tell.

I'll start with the obvious one. Is Malloc etc being used?

Next most likely culprit is your window. Gem is none too forgiving
about you attempting to open a window which is already open or closing
one which is already closed. This is one of those things which can
'upset' it as described above.

Another thing is doesn't like is you pumping data into the message
pipe so that it overflows. SingleGem has a very small message pipe
compared with the multitasking versions and there is no way to detect
if you've overflowed with its version of appl_write. If the window
size isn't within reasonable limits then expect it to sulk also.

Null/silly pointers for the WF_NAME and WF_INFO lines are good for a laugh [not] as well. Check the code isn't getting stuck in evnt_multi etc.

Dunno how it manages to do it so often but SingleGem has a habit of managing to corrupt your code when it's in a mood. If you get really desperate, move your functions around in the source code [or otherwise cause the linker to rearrange the object code] and see if there is any difference in behaviour. If there is, track down the function being corrupted. Print its address and start hunting for data pointers with value in or below the TEXT segment.

Finally, if the darn thing works fine when using a debugger, then you're almost certainly looking at a memory leak.

One last thought: 'multigem' may not mind you issuing wind_close in an Acc after AC_CLOSE but singlegem probably will.

I've noticed inconsistencies with ARGV. It was invented by Mark
Williams Company and formed part of their compiler. The docs are
reasonable upon this matter and the runtime startup sources (asm) are
available also, making the matter abundantly clear. Unfortunately,
what Mwc invented was not quite what got implemented. I have no idea
if someone misunderstood the Mwc ARGV implementation (understandable)
or decided to improve upon it (unforgivable), or just never knew Mwc
had already implemented it (unlikely).

I decided to write another Mwc startup which used the implemented ARGV
and found like you that MagiC/Ease was doing something different yet
again. It seems there are at least 3 different ARGV implementations.
This alone was reason enough for me to forget ARGV until someone could
explain why. No-one has yet!

For those tempted to jump in half cocked ... ;-)

This was quite some time ago so I can't remember the technicalities.
Aside from that I've no interest in getting into a "this ARGV is
better than that ARGV" debate. All I'm interested in is hearing if the
matter gets resolved. Here's the Mwc runtime startup for perusal ...

```
/
/ ST C run time startup.
/
.prvd
.globl errno_
```

```
.globl environ_
.globl _stksize_
.globl _start_
errno_: .word 0
environ_: .long 0

Another explanation could be that they did not quite implement what was
specified by Ken Badertscher, Atari. I do not know who was first, but Atari
had the rights to do the specification, so that is the only valid one.

Do you allocate memory, and keep it allocated for any significant time ?
Or do you keep files open for any significant time ?

Since under singleTOS all main application and accessories are the same
GEMDOS process, both will lead to serious trouble, possibly what you've
observed. Particularly the dependency on running a program will show up.

Cheers Peter

1837. Mummies Playtime Completed and Released

Newsgroup: comp.sys.atari.programmer
Date: 1998-06-14 00:00:00 UTC
From: Deano@zetnet.co.uk
Message-ID: <358d2263.3572565@news.zetnet.co.uk>
Source record: 4247

I have finally released Mummies Playtime, and you can download it if you go to my site from my Atari Page. It needs two meg to work but I haven't been able to get it to work under Pacifist.

If you downloaded a test version then you will need to get rid of that and download ALL the zips. I originally said you would only need to download the main zip file after but I've had to alter a few things on the other disks....

Please let me know what you think.

This exemple work fine for STDOUT but most software use STDERR
(handle=2), the redirection is the same for most systems but don't work
with MINT.

Yeah, I have heard about it before. The solution is to remove the
RAM checking for now or get a AB040 with Fast-RAM. :-)

> Could you take a look?

Maybe..... as it's far from finished anyway I would not recomend anyone
to use it. I'm not sure I will ever finish it either as I don't realy
use it my self. Do you actually use it or did you just try it?

I would not think so either as it's taken straight from one of his sources
and contains lots of more or less usefull stuff.

> no objection to distributing my D'n'D routine... hmm... actually, they
> are already distributed I think as IIRC GEM-DEU has the routines...

AFAIK GEM-DEU can only handle a drag'n'drop message, not create it.

1843. Assembly programmer

Newsgroup: comp.sys.atari.programmer
Date: 1998-06-15 00:00:00 UTC
From: msbaines@cix.compulink.co.uk
Message-ID: <EuLsoD.MK@cix.compulink.co.uk>
Source record: 4157

Hi

I've been using some assembly code from Jon Ellis (ST Applications article) which determines the type of 680x0 CPU it is run on. Up till now it worked well but recently it fails badly (causes a 4 or 6 bomb crash) on a new Veloce+ 68020 add on board for a ST from The Upgrade Shop.

Jon doesn't seem to be around any more so is there any one that may look at the code for me and check it over. It's in Lattice C assembler format but that shouldn't matter too much only the C interface stuff.

Also, any one with a 68020 add-on who might run a little test program for me to see if the problem is specific to this one board?

Many thanks

Slainte mhath
Mark

AFAIK, yes, almost. Don't check for >1, though, check for != 1. Geneva and MultiTOS both set global[1] to -1, meaning "unlimited". The last I knew, MagiC set it to some positive number >1.

Actually, it was sold seperately (it wasn't finished when STOS was launched).

> Either way you should be able to
> get it from any good PD library.

Do you feel like nameing a few? ....officially, STOS is not PD.

> (It's called COMPILER.ACB, ran in by
> hitting HELP)

It also needs the contents of \compiler\ to work. And once you have a
copy of the compiler, download my patched "207beta2" as it fixes a few
bugs, in particular compatibility problems...

I wasn't so much refering to the endianness of the processor, although I did get this wrong in my original post. I was really interested in knowing the order in which words will be physically transferred over the data bus. If I make a more concrete example it might clarify things:

The DMA chip has two 16-bit registers located (IIRC) at $FF8604 and $FF8606.
$FF8604 is the data register
$FF8606 is the control register

The contents of the control register affects what value is currently available in the data register. Normally, you would access these registers as follows:
move.w #select_data_register,$FF8606
move.w #write_data_register,$FF8604

But could the two instructions be compressed into a single one, such as:
move.w #(write_data_register<<8)+select_data_register,$FF8604

Ie, will the single instruction first select the correct data register, then write the data, or will it write the data using the previous settings and then select a different data register.

TOS 1.00 uses such an optimisation, and I need to know whether it is a bug or an intended feature.

The cpu will write out the value with increasing addresses when talking to
a narrow port. This is true for all 68000 variants with dynamic bus
sizing.

I have converted my latest game to work on one meg machines which you can get from my Atari Page. It works under Pacifist but I couldn't get it to play the samples under V0.48. Note if you downloaded the old two meg version then you will have to re-download all the zips files for the new One Meg version to work.

Source record: 4167

Hello Roger,
> Use a DOS manual. The syntax is practically identical.

Yes, I noticed that, but look at the following (it's Atarirc's install.bat):

```
STiK's IRC-Client (PRG/ACC-Release)
$mkdir @DOC
$mkdir @DOC\ATARIRC
$mkdir @ATARIRC
$copy atarirc.app @atarirc\atarirc.app
$copy atarirc.rsc @atarirc\atarirc.rsc
$copy atarirc.doc @doc\atarirc\atarirc.doc
$copy changes.txt @doc\atarirc\changes.txt
```

If you run it, it gives "Kommando night gefunden" for each line under Magx shell.
See those "$" and "@", probably to disable the commands? Seems there is a convention as I've seen it in other batches. And if there is, I'd like to know more about.
Bye !

> or an intended feature.

The same trick is used for programming the soundchip,
$ff8800 is register select
and
$ff8802 is write selected register
lots of programs using the soundchip use a long to select a soundchip
register and write data to it. i.e.:
move.l d0,$ff8800

The 68000 will write, in compliance with its spcifications, first to the
lowest adres and then the higher adresses. This is also true for
move multiple instructions.

Hans

You can't, atleast not legally. Since you can't specify what
VDI-workstation objc_draw() works on, it will only draw to the device
that the AES use (i.e. the screen).

Why dont you use a CSH shell giving a CSH scrpit ?
Making a small executable who will launch this script sould
not be complicated, this sould be easyer to make because
you'll have all the documentation you'll need, and more
over this could run an a simple ST under single task TOS !

1866. VA_START msg format : a Pascal string?

Newsgroup: comp.sys.atari.programmer
Date: 1998-06-21 00:00:00 UTC
From: frederic.dinh@hol.fr
Message-ID: <6mjc1k$14g$1@news4.isdnet.net>
Source record: 4180

Hi everyone,

I finally got VA_START working with the following:
pointer = * ((char **) message + 3)

(thanks guys!)

Surprisingly, when I display it in a window info line (wind_set (wid, WF_INFO, pointer)), I get a Pascal string: there is a "prefix" caracter, for exemple the bell (ascii 10) if I drop a 10 caracter filename on my prog.

So my question is: is the VA_START message is in Pascal format? The few docs I have don't mention that. I tested with Magxdesk with or without AV_SERVER, and the results are the same.

1868. Fonts in userdefs

Newsgroup: comp.sys.atari.programmer
Date: 1998-06-22 00:00:00 UTC
From: joes@chem.sintef.no
Message-ID: <358e543a.20250538@news.sintef.no>
Source record: 4182

```
Hi!

I'm trying to change font in a userdef, but for some reason it doesn't
work.

Even if I do something like:

vst_font(vw, fontid);
v_gtext(vw, "some text");

...the text is always written with the system-font. I *know* that the
font-ID is correct, and that I use the correct virtual
workstation-handle. Is there something obvious I'm missing? I have no
problems in changing fonts in other parts of the same program.

I have a problem...
I compiled a program and while I was testing it, I noticed that the rand()
function wasn't working. So I tried it by itself in a seperate program. It
worked!
Anybody any ideas as to what's happening?
I was using C68k on a 4Meg 520 STe, if that helps...

Thanks in advance,
George Shore.

You might want to check to make sure you are definitely opening your own workstation (via v_opnvwk()) rather than simply using the AES's workstation, as returned by graf_handle().

But why do you want to use a USERDEF ? You can use a normal text
object with the voctor font attribute ! It works well with AES up to
4.0, and it draws a system font in others... and you can edit your RSC
file with the patched Atari's editor.

1873. Video Titler / Degas PC1 display

Newsgroup: comp.sys.atari.programmer
Date: 1998-06-22 00:00:00 UTC
From: dlormand@aztec.asu.edu
Message-ID: <6mmc1n$3t2$1@news.asu.edu>
Source record: 4187

Hello,
I have a mini-project to turn a STfm into a video
titler machine feeding a video projector (via the
built-in composite video output!) for a sing-along
application. Right now, I am using Degas Elite to
create slides of the verses, and the SHOWPIC2 program
that came with Degas to put them up.

The problem here is that SHOWPIC, like all the other
slide show programs I have seen, simply picks the files
off the disk in the order they were loaded on and displays
them automatically, with an option for manual pause.
There is no opportunity for starting at an arbitrary
point in the sequence, or for going back to a slide if you
made a mistake and unpaused too quick. Furthermore, if you
have a bad slide or data error, the show is over, since
there is no other option for recovery than starting from the
top.

What I would like to see is a program that displays Degas PC1
slides, using a text list of filenames that can be arranged
externally with an editor, with advance or backup via the up
and down arrow keys. Furthermore, the list can be brought up
for the user, say via the Esc key, and a cursor moved up or down
(note: no mouse required) to pick an arbitrary start point.

This doesn't really sound too tough, and if I were closer to
picking up ST programming, I might try it myself. But since my
requirement is NOW, I would like to ask

1) Does this sort of program already exist somewhere? If so,
where can I lay my hands on it?

2) If it does not, do any of you hacks want to take a quick go
at it?

Ok. Here it is:
double frand(double x)
{
return fmod((rand() % 100) * .01 + rand() % 10000, x);
}

> Also, what do you mean by "rand() wasn't working"?

What I meant was that when it was called, rand() wasnt giving me a random
number but always 0, and when I tested rand() out by itself it was. Sorry
about my vagueness. :-)

Hi,

I compiled this program in Pure C and it is working good:

-------------------8<-----------------------------------

#include <stdio.h>
#include <math.h>
#include <stdlib.h>

double frand(double x)
{
return fmod((rand() % 100) * .01 + rand() % 10000, x);
}

int main(void)
{
int i=9;
double x=12.34;
do
{
```

```
printf("%i frand(%lf) = %lf\n",i ,x, frand(x));
}
while(--i>=0);
return 0;
}
--------------------------->8-------------------------
```

Bye, Hans

It seems like it should work. This may be a dumb question, but do you have any other functions named "rand()" that may be getting linked in? Aside from that, I can't think of much else...

>from that, I can't think of much else...

There's also the apparent lack on an srand() call, which might cause
problems. From the docs I have, it looks like the default seed value
should be 1, but that may not be standardized. It is possible that the
algorithm used in rand() will return all zeros if the seed happens to
start at 0.

On another matter, are you using a 16 bit compiler (like PureC)?
If so, the return value from rand() is most likely 16 bit and then it
looks to me like the %10000 wouldn't be a very good idea.
The maximum number would be 32767, which means that there are four
possibilities for 0-2767 to occur, but only three for 2768-9999.
There would still be a skew in the probabilities if you have 32 bit ints,
but then it would be very much smaller.

Another thing to remember about 'random' number generators is that the
number as a whole is usually a lot more 'random' than the low order bits
(rand() % 2 might give 1,0,1,0,1,0,...), but you should not be running
into that here.
I've seen some very funny effects of this in image processing software,
such as pixel spreads that tend to go mostly right and down and 'noise'
with very obvious patterns.

Here you are: It is only a simple one, but it is goodenough for not very
large amounth of strings (up to 10000 I think)

long Hash(char* string) {
long res;
for(int i=0;i<strlen(string);i++) res += res << 4 + string[i];
return res;
}

stay tuned

Don't know, but I would hope CAB would stick to HTML 4.0. Is this an
IE4 specific tag?

This will make it *very* inefficient especially for large strings, and you
are discarding most of the info from string contents anyway.

Message-ID: <Ev6JCr.BKD@uia.ua.ac.be>
Source record: 4103

Why don't you use the 'mother of hashkind' :

```
int HashCode(char *string)
{
char ch;
int code = 0;

while((ch = string++)
{
code += ch;
}

return ch;
}
```

It's dirty code, I know, but the idea is to just add all ASCII values in
a integer ; it will wrap around to negative when the upper limit is exceeded.

Greetz,

>Anybody any ideas as to what's happening?

rand() should return a fixed set of random numbers. That is, each
successive call returns the same random number as last time you ran
it. This may seem odd but the advantage is you can debug programs this
way. For true (pseudo) random number generation you have to 'seed' it
with srand(). The number you pass to srand() should be 'evenly
distributed' - that is, at the point you do srand(whatever) then
'whatever' should have as good a chance of being one value as any
another. Typically, using the system 200Hz timer does the job.

Additionally, if rand() relies on the system Random() call then note
that Random() has 50% distribution on the lower bit, according to
docs. This will make bit 0 useless so >>1 etc.

objc_draw() writes to the logical screen address but multitasking
systems prevent you from making effective use of it, as might a video
card.

>(If I sound like Iï¿½m confused.. ...thatï¿½s probably because I am.. 8)

If at all possible you're best off responding to the normal WM_REDRAW
message in the usual way. Faster machine's will be able to cope and
such operating systems as MagiC have their own redraw enhancements
where unecessary redraws are eliminated, in addition to such schemes
as NVDI's font cache and other optimizations.

But this will generate lots of identical hash codes, say for anagrams or
post codes or telephone numbers making it useless for data lookup....

Take this into account by making the order of the characters part of the
hash function.

Personally I use Lattice C's _hash() function which has never produced
duplicate values so far.

True, but then you assume you know what your strings look like. If your
strings are random, then this one is good enough (I used it recently in
a compiler to hash identifiers, and had no problems with too many
collisions).

: Take this into account by making the order of the characters part of the

You'll need strings of more than 256 characters for that wrap around to
happen...

>: But this will generate lots of identical hash codes, say for anagrams or
>: post codes or telephone numbers making it useless for data lookup....
>
> True, but then you assume you know what your strings look like. If your

If your strings are random you don't need a hash function!
Just take the first couple of bytes and use that... ;-)

> a compiler to hash identifiers, and had no problems with too many
> collisions).

In most programs there tend to be lots of variable names with one to four
characters and with your scheme they would all get a hash number less
than a couple of hundred. Actually, things are much worse than that since
characters only use a very narrow range of numbers.

Still, unless you have to worry about large programs with thousands of
identifiers, you can probably get away with it.

>: Take this into account by making the order of the characters part of the
>: hash function.
>
> Then I recommend the Fletcher Checksum : easy and takes care of position.

Haven't heard about that, but a simple shift of the 'sum' before adding
each new value is lots better than what you suggested. Even on an old
68000, the speed difference should be very small.

>: Personally I use Lattice C's _hash() function which has never produced
>: duplicate values so far.
>
> Well then, I suppose the writers of Lattice C have shattered all Computer
> Science theory ;) Never, you say ? How do you know ? Have you checked

He said he'd used it personally, so it would of course be for the data
he has thrown at it.

I guess we all agree: Atari could have been a contender, but it suffered through several managements that just didn't manage. It's no sadder today than when you and I first discussed it; in fact, I think the situation is even brighter today than six months ago because of what I see in this ng, on the mailing lists, in FidoNet, and from users in general.

All,
Speaking of the Amiga, Gateway has announced that they are working on a
new Amiga computer. OS 4 will be a tempory OS for software companies to
build apps then when the new machine hits the streets next year, it will
have OS5. They said that this machine will be better than any consumer
PC available.

Gateway actually haven't announced anything (AFAIK) but Amiga International
have released those details. They do have full support from Gateway
however, including substantional financial support.
PPC has been dropped in favour of an as yet unavailable CPU/Processor which
supposedly will feature a programmable instruction set.
The new system due in 1999 will be 5-10 times faster then current PII
400Mhz/100Mhz bus systems.
OS 5.0 will be the OS running on this system, with the developer OS 4.0 and
machine (Amiga/PC hybrid) released later this year to allow developers time
to develop applications for the new system and to have them ready when the
new machine is officially released.

Current PPC upgrades will continue to be sold and supported with the manufacturers of these boards (finally) working together to support the Amiga community until the new machine is available.
The OS 3.5 upgrade has been cancelled by AI.

With Gateways backing the Amiga could once again be a viable platform. Besides, we must be due for another platform to kick the shit out of the current Mac and PC systems. How stale can it get ?.

Regards,

Clockmeister.

Yes, but only if the the system is open and if people are eventually
able to build one themselves from modular components as well as use
industry standard cases, video cards, etc. etc. I don't care WHAT
cool things they put in it if it is going to be another eighties
style closed up box that can only be minimally upgraded with
manufacturer supplied parts.

Apple will yet die of this disease. We don't need another carrier of
it.

If you ask me this new computer doesn't realy sounds like a Amiga at all. It will only be compatible with old amiga apps through emulation. The OS will be completely new and based on a outside developed kernal like BeOS, or Mach. This you can already be done under Linux. It will not include a Motorola CPU, it's probably going to use intels comming Merced chip, or something else shitty. The "new" amiga which will be like a bridge to the new platform which will be released later this year will be based
on the Pentium, so it's clear that they will go for the x86/intel line like everyone else. Don't forget that Gateway has only made intel boxes and never even seen a PPC.

Basicly it's a completely new computer and OS with the Amiga name on it. It's like buying a PC whith the Commodore sign on it. It has got nothing at all to do with Commodore.

What about the Digital Alpha work stations?

That are real computers! After an 8 bit spectrum and a 16/32 bit
Atari it is time to scale up again. Not to a lousy 32bit system. That
was interesting 10 years ago. Nope, time to get 64 bit hardware, that
is progress!

The Alpha processor is for serveral years the fastest processor
available. The newest stuff if quite expensive. But if you go for
the outdated stuff you get a good price. Outdated are:
300-400MHz 21164 processors, they come typically with 96kB
2nd level cache and 1Mb 3rd level cache.
(My system, 300 MHz Alpha 21164, 1MB cache, 64MB RAM, SCSI CD ROM,
1GB SCSI harddisk, Matrox Millenium graphics card and ethernet
network was about NLG 2500 or about 1250 US$, half a year ago.)

Take as OS Linux and you have some real computing power on
your desk.

Bye, Hans

In all the projects I have used the _hash function in (see my CPXs on my web site) I know what the data file is as I construct it :-) and I run it through a test program first to make sure that there are no duplicate hash values.
I've no idea what algorithm they chose but so far so good :-)

Apple has been around for over 20 years. That's a long time for a computer manufacturer. I don't think they'll be disappearing any time soon.

Are you saying that if a new ST was released it would have to be 100%
backward compatable with the old eighties designed hardware ?.
Emulation is a great solution for backwards compatability.

> new and based on a outside developed kernal like BeOS, or Mach. This you
can already

The kernal will "borrow" parts from other OS's, a lot of the features of
workbench will be retained and enhanced further.

> be done under Linux. It will not include a Motorola CPU, it's probably
going to use
> intels comming Merced chip, or something else shitty. The "new" amiga

Gateway wouldn't pay $40 mill for a virtually dead platform with only a
small user base and then spend money on redevelopment to sell rebadged

PC's. Who'd buy them ?, Amigans certailny wouldn't and neither would Joe Blow.

It's for real dude, and it's an Amiga and it's not a PC.
I can't see a PC being 5-10X faster then the current PII by end 1999.

Besides, what the hell is the problem with having another alternative to Intel ?.

Sour grapes ?
:-)

Regards,

Clockmeister.

The Alpha 21264 is, esp. on the floatingpoint part. Integer
specs are a bit less. And this processor is shiping now. It's
not some magical vapor ware like Intel Merced or a 'quantum
processor' to be released in 1999. It is simply the fastest
processor available.

Bye, Hans

5-10x times faster than what? A sluggish 266MHz P2, or a 400MHz? I wonder
how they define "todays PCs"?

And which is this mysterious CPU?

> Besides, what the hell is the problem with having another alternative to
> Intel ?.

Nothing! Did you say that?

> Sour grapes ?

For what? I think you have missed something obvious and the funny thing is that
you doesn't even know it.

The current Alpha (available since last year) is 4-7 times as fast
as a P2. Next one out next year will be between 8-15 times as fast.

I have decided to release my program Zorg as a freeware under GPL.

The archives are on ftp.lip6.fr in /pub/atari/Incoming and should be
moved to the Disk/ directory soon.

The files are:
- ZORG_210.LZH for the binary without any limitation
- ZORG_SRC.LZH for the sources (Purce C 1.1)

If someone wants to continue the developpement please contact me.

Questions and/or answers by mail as I have no time to read these
newsgroups.

1920. Disk/system info please

Newsgroup: comp.sys.atari.programmer
Date: 1998-07-03 00:00:00 UTC
From: m w grossmann <mwg@select-ware.com>
Message-ID: <359D70B5.1AFC@select-ware.com>
Source record: 4135
Cross-posted to: comp.sys.atari.programmer,comp.sys.atari.8-bit

I've provided a lot of Atari system info to people who worked on emulators then stopped. Finally, the Atari800Win is out and there's good reason to get to work on this myself.

Since I haven't been able to find it out there, I am going to work on a programme to allow the PC to read Atari disks so that the data can be saved. I need ANY info you might have concerning this project. Info on programmes such as MacDrive95 would also be useful, since that programme hooks into Win and allows the PC to read/write/format foreign (Mac) disks.

The programme will probably work under DOS and may use an older version of MS or IBM DOS, like 6.0, 5.0 or even 3.2. Transfer will also probably only be to the 3 1/2" floppy to avoid having to deal with the hard drive and the FAT16/32 and long names systems.

I and my partner were the largest Atari software and hardware err... "experts"... in the '80s and are both interested in making a lot of the now-defunct software available for archival purposes (standard MAME-type disclaimer here). He also wrote a couple special "mini-DOS"es to load multiple programmes/cartridges (we placed many on diskettes) and we'll make these available for the emulator, too. We have more than 3000 (no typo) disks, both boot and binary files, that we want to save. Many are already being lost to aging.

As further temptation, we have most of the cart games/programmes in binary form and also have a lot of the languages and boot games. Oh... we also have all the 5200-to-800 conversions (and the source code AND a way to convert all the new 5200 images that are out there to 800).

Your help is greatly appreciated.

Respond/reply to bad_doggie@hotmail.com please.

Cheers-

m w grossmann

Titanic was officially render on Alphas running Linux.
Amiga can probably do that, they did an great job in babylon 5, but the
Titanic team decided to use Alpha/Linux combination.

Hi,

I am looking for some brave souls to try out a Perl 5.005 beta
release on MiNT.

Background: a guy called Guido Flohr did the port for an earlier Perl
release last year. I now upgraded his patches to the current Perl
5.005 beta -- but Guido isn't answering his email (maybe he is on
vacation or something) and I don't have MiNT to test the code on.

So, if any of you kind people who have MiNT and some time to spare,
could you please grab

http://www.iki.fi/jhi/perl5.004_69+mint+mpeix+mvs.tar.gz

and give it a good MiNTing.

Note that some experience in Bourne shell scripting, C programming and
debugging, and the Perl language itself may be needed to get 100%
"make test", depending on how badly I botched up Guido's work...

Having built Perl on other platforms would be also a definite plus
because then you probably don't need to read the "INSTALL" file and
you know what "running Configure" means.

And what will they die from? I guess you have not been keeping up with the happenings in Cupertino lately.. With the imac on the verge of being released and continued high G3 sales moving forward, what more could you want?

Peter S.

They did a great job on the first *FEW* episodes of B5, but they went to more
powerful equipment later. Also, it was an Amiga coupled with the Video
Toaster, not just an Amiga alone.

Amigas, could indeed, reproduce the efforts accomplished by
the Titanic render farm even without the Toasters...

They used Photorealistic RenderMan from Pixar. This is a quite
expensive aplication, only used for rendering. The RIB data
(RenderMan Interface Bytestream) was generated by an
export function of 3D-Software Softimage.

A even better renderer is freely available for Linux, the Blue
Moon Rendering Tools (BMRT) of Larry Gritz. This software is a
combination of a raytracing and radiosity renderer.

As 3D modeling tools you can use Amapi 2.11, SCED, Leo3D or
AC3D. For correctly moving physical bodies you could use
Xaero.

And ofcourse you have good old POV ray, whici can be a very
fast renderer when you are yousing a Beowulf configuration.

I am quite sure this list wasn't complete.
So there are some 3D tools available for Linux.

(No I am not a 3D software specialist. I am just a reader
of the excelent German magazin C't (Computer Technik), they
have a very good coverage of Linux items.)

Why
>buy something worst, heh? Obviously, they want to copy it.

AFAIK Alpha processors are manufactured by Digital which is now owned by
Compaq and they're the one who own the technology. Judging from your
conversation Intel have bought or licenced Alpha technology, is this true?
If that's the case, where can I find more information about this since I
have obviously missed something.

But this copy part is ridiculous, Intel needs the latest in technology just
because of their efforts to keep the old structure and concept they used in
the Intel x86 processors. A concept dating back more than Intel CPU's and
that was great ... back in the 80's in the first Z80 home computers. Today
Alpha and PowerPC processors are way ahead if you compare the ratio between
technology used and performance given. Intel has often used better
technology if you look at plain electronics involved. Still they get
outperformed by relatively simple and cheap RISC processors.

The article was from First! by NewsEdge Corp. You can find them on
http://www.newspage.com, but that was several weeks ago.

The were using some of their own programs. I cannot recall what's the name of
the program.

I would think that the Alphas only did the rendering, so it shouldn't be to hard to port a
renderer to it. The editing probably took place one something else.

The point was: Amiga can ALREADY run the OS an necessary
support tools. All D2 would need to is to copy them over
to the Amiga farm and re-run make.

Linux/68k ~ Linux/Alpha...

It's the OS, not the hardware that's the central
point. D2 is a unix shop so any other Unixen fit
in rather easily there...

If that is the case you can still do it with most things with a CPU
and now Linux. You can run Linux and MiNT on a ST, so a ST can do it,
so what is the bid deal?

Genuine ubiquity vs. that smoke and mirrors version that
Monopolysoft had been pushing for so long...

So? When can we see KDE or Gnome ports for MiNT then?

Hi!

In article <Pine.BSI.3.96.980704120947.25032A-100000@usr01.primenet.com>,
Katherine L Ellis <kellis@primenet.com> writes:

```
> function exist(p$)
> $F%
> local r!,e&,sdta%
> inline dta%,64
> p$=p$+chr$(false)
> sdta%=gemdos(47) ! get old dta
> ~gemdos(26,L:dta%) ! set new dta
> e&=gemdos(78,L:V:p$,W:false)
> ~gemdos(26,L:sdta%) ! reset the old dta
> [...]
```

An even better method would be to try Fxattr() first, as Fsfirst() (which
is used here) can't handle long and case sensitive filenames correctly.

As I'm not such a good Gfa-coder, so please don't bash on me if the
following is not fully correct:

```
[beginning of function (up to and including the inline-statement) as above]
local xattr&(22) ! 23 words (0-22) for the XATTR result (46 bytes)
local xr% ! Fxattr() return value, must be a long to check for EINVFN
'
p$ = p$ + chr$(0)
xr% = gemdos(&h12c, 0, l:varptr(p$), l:varptr(xattr&(0)))
if xr% <> -32
' Fxattr() is supported by the OS, so check whether it succeeded
if xr% = 0 then
return true
else
return false
else
[insert code of original function from sdta%=... onwards]
endfunc
```

Note, though, that both the call to Fxattr() and the call to Fsfirst() do
not check whether the found item is really a file or not. It may be
anything, a file, a directory, and (for Fxattr()) a fifo, a device, a
process file, etc.

Also note that my call to Fxattr() does dereference symbolic links, e.g.
it checks for the existance of the file a symbolic link points to, if the
given name refers to a symbolic link. If you don't want this, exchange
the 0 in the gemdos(&h12c)-line into a 1.

As far as I know, Gfa does not allow structures (or records, if you want), so using the stuff Fxattr() put into the word array is a bit tricky, as you have to know the exact offsets and especially because some members are longs, not words. But you'd only need that to check whether the directory entry p$ really is a file, and nothing else.

Ciao

Thomas

Download the source and re-compile it on your Falcon or
Ameoba. This should work with Linux as the rest of the
system is open source.

But how many Amigas do you want to use to do it? Rendering is strictly a number crunching affair. Rendering has nothing to do with the graphics hardware that makes the Amiga special. One Alpha machine running at 533 Mhz can probably do what 50 to 100 '040 Amigas could do. Just the savings on power consumption would justify the use and purchase of ONE Alpha as opposed to upty million Amigas. And the Titanic people were using a FARM of Alpha's to do the rendering. And yes, other tools were used to generate the scenes. If I remember correctly Mac, NT, and Unix boxes were used to generate the scenes.

I doubt that a Unix shop like D2 would put up with Mac
& they likey only put up with NT because of it's market
inertia/vendor support.

NT was the frontend, Linux was the backend. Although a
port of Lightwave to yet another Unix shouldn't be too
strenuous...

Judging from the replies, it looks like EXIST doesn't set a DTA
buffer, or sets it incorrectly.

You'd have to write some code to insert relevent data into one of the
buffers used by Kbdvbase() and have some scheme whereby you could tell
it was really midi data when the app received it.

An easier and (imo) better solution would be to send the midi data
straight to your application via appl_write().

1955. WF_KIND to change window elements

Newsgroup: comp.sys.atari.programmer
Date: 1998-07-09 00:00:00 UTC
From: rosco@game-master.com
Message-ID: <35a4fd222b17e0@game-master.com>
Source record: 4070

Does anyone know how to use WF_KIND() to add window elements to an existing window?

I want to add a vertical slider and arrows to an existing (and open) window. I'm using the GFA call

~WIND_SET(handle,1,&X111001011,0,0,0)

Theoretically this should do the trick, but nothing happens. I've tried closing the window first then reopening it, doing a redraw...

I could delete the window and then create a new one, but I'd prefer to just change the existing one.

1957. Scancodes for extra keys

Newsgroup: comp.sys.atari.programmer
Date: 1998-07-10 00:00:00 UTC
From: mb@tos.pl.net
Message-ID: <GWKZCXG@tos.pl.net>
Source record: 4072
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.programmer

Are there any scancodes defined for the extra keys present on some keyboards (I am looking at a AT keyboard), for example the F11 and F12 keys, End, Page up, Page down, Scroll lock, Num lock, Print Screen and Pause. Also some newer keyboards have a few extra keys as well, such as the "Windows" key.

If there are not any scancodes assigned to these keys, how should they be handled on such a keyboard? What should keys like Scroll lock and Num lock do? What does Scroll lock do on a normal IBM compatible?

With Num lock I could make it simply return number keys when on or arrow/alternative keys when off on the number pad, is this the correct behaviour, or will this be handled by TOS if I make Num lock send the correct scancode? If the latter, how should I know when to turn the num lock light on the keyboard on and off?

As for caps lock, the computer can at any time change the state of the caps lock without telling the keyboard, I believe, so is there any way I can know what state the caps lock light should be in (on or off) at any time?

(I'm talking from the point of view of the keyboard.)

Thank you for any hints.

The border around the window can be any width. Your application software doesn't have to know how wide it is, but you can find out by using wind_get. The original Atari AES never used a border wider than 1 pixel, and there's no way to set that. If some other AES does allow that size to be configured, you would have to look at the documentation for the particular program, since there's no standard way of doing it. Application software doesn't need to worry about the border width anyhow.

From: Russell Magee <bigruss@cheetah.spots.ab.ca>
Message-ID: <6o6vta$pe1$1@f02s02.tac.net>
Source record: 4076

Hi,
I'm trying to compile some code using SozobonX 2.05 (?I think). The code will compile with the default (-mshort) int size, but if I compile with -mlong, the code bus errors somewhere during C startup, before main is entered. (Looks like somewhere during or slightly after parsing the environment variables, in MonST). I'm running on an Atari TT/030, TOS 3.06.
Is the -mlong option just broken, or do I need to include special libs, or what?

Thanks,
-Russ

It's in the GFA manual at least...

There are some programs around (like KIVI QWK) that allow you to
customize window elements on the fly. I would imagine that WF_KIND is
used for this purpose, unless there's another call that I haven't come
across.

In KIVI the change of window elements is very smooth and it sure
doesn't seem like the window is being deleted and then re-created with
new elements. How do I do this?

It's also in the Abacus GEM programmers reference and Compute!'s Technical
reference guide Atari ST: AES, so it has been documented. I wonder if it's
in the Compendium, anyone with a copy care to look and see?

1970. Code to convert Atari Works STW file into ASCII

Newsgroup: comp.sys.atari.programmer
Date: 1998-07-12 00:00:00 UTC
From: gmiller@inca.co.nz
Message-ID: <6o9aag$7v$2@newshost.comnet.co.nz>
Source record: 4085

I am trying to write some user manuals and readme files, using Atari Works.

If I select "Export file" from the menu, and then choose "plain ASCII", I get a file containing a number of _very_ long lines (200-300 characters or more) for each paragraph. (read: each paragraph becomes one long line of ASCII)

Is there some source code somewhere I can use to read and translate the STW file that Atari Works saves its text into, into 70-ish width lines? Or is there a utility I can use?

Doing so by hand, using an ASCII editor (like the one included in Devpac, Lattice etc) is tedious when the files get lengthy.

WF_KIND used to be listed as a parameter to wind_set() and wind_get()
earlier on (pre-1990).

ie "wind_set(handle, WF_KIND, NAME|CLOSER|MOVER, ...)"

I can vaguely recall seeing it listed in the (circa 1986) Megamax C
manual.

And WF_KIND is still #defined in the Lattice C 5.60 aes.h file, but isn't
defined in either the v5.06 (ring-bound! one function to a page! hooray!)
or the 5.60 (perfect bound. many-funcs per page. boo!) manuals.

#define WF_KIND 1

What does it say about it in these two books? I really would like to
use something that could change window elements on the fly. CAB does
it, KIVI does it...how do they do it?

:workstation) and other Sun 3 machines. There is no problem running X
:in 4MB. Of course I don't know how big a footprint MiNT has (my Mega
:4ST has been in storage for a few years).

According to reports (years ago) in this forum you can have X with an
xterm and a shell up and running without problems (in 4 meg), but thats
about it. MiNT itself is not the problem. The Xservers I have here are
sized in the range 2.5 - 3.5 megabyte. I'd guess that the one for ST is
about the same size.

I don't know about KIVI, but CAB uses "faked" window gadgets. It's not
real window gadgets, but self build which acts just like the real thing.

Hi there,
along time ago there was this cool little hand held console
called the Lynx. Unfortunately it was too bulky and had too short a
battery life and was discontinued.

The Lynx Development kit was little box from a company called Epyx,
who originaly designed the "Handy" console (a.k.a. Lynx), and the
engineers also worked on the original Amiga!!!

This little box, called Howard I think, linked to the Amiga via the
parallel port.

I was wondering if anyone had one of these development kits and the
software, possibly in a dusty corner somewhere....

Perhaps your company did Lynx development and you have a couple of
devkits in the warehouse gathering dust??

I'd really like to get hold of one, so if you have one get in touch

Cheers
Alex Holland

P.s. I dont read Usenet too often so email me direct could you??

CAB uses its own window elements (because of Frames).

Bye,

I believe there was once a commerical magazine called '"ST World"
which was the first of the ST Mags to die. Is there anyone who can
provide me with some info about it including a screenshot of the cover
in Gif format? I want to write an article on it and I need to know...

1. What year (and month if known) was the first issue released?
2. What year (and month if known) was the last issue released?
3. Why did it cease publication.
4. General info about the contents IE: tutorials ran, regular features
(news, PD Reviews, other reviews etc).

I would be grateful if anyone could give me as much info as possible
on this.

Note: I am talking about ST World and not Atari World, two different
magazines.

>box and a Linux/PC?

It's not possible, Linux and MiNT use different protocols for IP on
the parallell-port. Unfortunelately the ST's (and all other models for
that matter) parallell-port doesn't support all signals used in
Linux-PLIP, so Linux will have to adapt to MiNT in this case...

According to both Compute!'s AES and GEM programmers, it's supposed to set
the window control flags, as you'd think it should do, although from the
returned value when trying it out, it doesn't exist.

The only thing I can think of, and it's a wild guess, is that these two,
and some other manuals and programming guides, took the info from the
PC-GEM docs rather from what had been implemented in ST-GEM.

1983. Search for midi softwares & programmers for Ste

Newsgroup: comp.sys.atari.programmer
Date: 1998-07-15 00:00:00 UTC
From: CORNEILLIE Vincent <vcorneillie@wanadoo.fr>
Message-ID: <6oiagm$5vh$1@platane.wanadoo.fr>
Source record: 4098

Hello,

I'm a french owner of an atari mega Ste

1) ****** I'm looking for softwares for it *******

I'm looking for

TRAX Recording Studio Utilities
(Tracksheet plus)
by Quentin Rice
(c) Quinsoft 1990

I had a demo of this and I'll like to buy the full version.

(It allows you to print a cue list, a track sheet, a mix sheet and you can store the names and adress of the consummers and musicians in a database.)

I also looking for :
-'Studio module' for Cubase V3.0 Atari.
- Dr T's XOR (Universal Patch Librarian for Synth's sounds)
- other Editor/patch/Librarian witch is fully compatible with Notator/softlink and can manage sounds of Roland D70 and Yamaha SY99

2) ****** I'm looking for a programmer on Atari St********

2.1) If I can't find Trax (see above...)
I'll like to have a soft for manage a small recording studio

2.2) the 2nd software must be faster because :

It must be able to show 41 differents "midi control changes" on one screen like 41 bar graph.

The control changes are showing the moves of the faders of an automated mixing console Tascam M3700. For each fader (32+8+1=41) the console send 3 midi bytes like :

-in midi : Controlchange,fader nï¿½,Value
-in hexa : Bn,yy,xx where 'n' is the midi channel (0h to Fh), 'yy' is the number of the fader (00h to 25h), 'xx' the level of the fader (00h to 7Fh)
-in deci : 176+(n),yy,xx where 'n' is the midi channel (0 to 16), 'yy' is the number of the fader (0 to 41), 'xx' the level of the fader (0 to 127)

I tried with the cubase midimixer but there is 3 problems :

-1) The fist fader send a CTRL CHGE nï¿½0 and this is not reconize by Cubase
-2) Because of the size of the cubase's faders, you can't see 41 faders in the same time on the screen (you must scroll the bars)

-3) I already use midimixer's objects for FX programming and I can use only
127 object simultaneously

I don't know if some software for other mixing consoles can work (Allen &
Heath,
Soundtracks, Soundcraft ??...) I'm specialy thinking about 'Spirit Auto'
Software or 'big by langley'.

Thanks for answering to my email

Vincent,

This is a real nice accounting program that was special made for the
recording studio. I have run the demo, sometime back and it looked super!

I didn't get it because my business didn't warrant it. The demo was on
Genie which is now becoming part of the www. FWIW

Charlie

Studio Manager - Invoice/Accounting v 1.xx

PRESS RELEASE

We are pleased to announce the commercial-release debut of

STUDIO MANAGER - INVOICE/ACCOUNTING

With the availablity of an inexpensive yet powerful computer
platform like the Atari ST, the concept of a computer-based studio
management 'system' seemed the obvious way to handle the various
'chores' that exist in the operations of a recording studio.
Armed with a handful of commercial and public domain
programs we went 'computerized'. With a stack of manuals to learn
and assortment of floppy disks we shuffled through the patchwork.
After two years of trying this and that, it was concluded that we
have actually create MORE work for ourselves.

We are music people trying to compete in the business world.
We were busy studying our craft, be it music theory, arranging,
MIDI sequencing or acoustics and recording techniques.
We also wanted everything that left the studio to be of the
best quality we could provide; from real-time cassette dubs to
our client's invoice statement.

With a 'vision' greater than our budget, the decision was
made to barter long days and nites at the computer in designing
software to address the unique needs of the recording studio business
and, thereby, help us in our overall pursuit. We were surely no
stranger to this type of schedule, and the parallels between music
production and software development provided pleasant revelations.
From a humble beginning, the 'INVOICE' program developed
into a essential tool that was used daily in studio operations.
When other studio people who, looking over our shoulder
or just 'checking out the computer scene', showed positive interest
in using the 'INVOICE' program for their business, the decision

was made to redesign the program architecture to work for any
studio. We also gave it a name at that point.
In what was to be a complete source code re-write for the next
generation of 'STUDIO MANAGER', with all new logic, features and a new
graphic user interface, the motto 'UP ALL NITE' became our theme song.

For some, the closest experience with a keyboard was either
a synthesizer or a typewriter, so the program had to be intuitive,
easy to learn, and quick.

Documentation notes:

If I told you about one of the more difficult parts of writing
this software package, it could easily be the documentation.
When I called on some of the various users of the program to
assist in the doc writing process, they laughed saying who needs
docs for the program ... it's self-explanatory. Of course, that
was one of the fundamental concept that went into the design, so that
may help explain some of the difficulties. The 'other' reason was the
amount of features within the program that everyone had just grown
accustomed to. Fair enough, but while the time drag on during
the doc writing sessions, I began adding requested features that
were scheduled for the next version upgrade.
We decided that the outline approach to describe the operation
of the program would serve the best beginning.
Other decisions had to do with the final 'form' of the docs.
The spectrum of choices boiled down to either pre-printed booklets
or the standard ASCII text file on disk.
So, the decision: we go the text file route and offer a
special introductory price for a limited time. The user base can
help us in making these, and other decision. As for the 'docs' issue,
if it is concluded that pre-printed is the way to go, then every
registered user will receive them. The expanded user base, along
with the on-line support, should provide us insight as to how both
the documentation (and software!) should mature.

At the very least, we hope that you find Studio Manager v 1.xx
has the basic foundation you've sought in a working solution for
your business of music.
I hope that you will join us!

Sincerely,

Ron

Future program development:
This being the debut commercial release of STUDIO MANAGER v 1.xx
we have tried to provide a foundation base program to handle the
immediate needs of the recording studio business.
The design for future versions will be based upon request from
the users as to new features and functions to be implemented.
Aside from the Invoice/Accounting system, other studio related

support programs in development include:
A client Fone Book database, Scheduling Calendar, Track Sheets,
Tape Labeling and Pre-Production modules.

Be sure to stop in at the GEnie support message base in the
MIDI RT (Cat 3 Topic # 2), or Email the author at RHFactor

Hello,

Thanks for the reply

The software look (looked ?) Great ! I 'll like to find it... but where ???

Does anyone know if there is a web site or an email where I'll find some
more informations (price, ordering...)

Thanks again.

Gaven Miller (gmiller@inca.co.nz) wrote:

: I am trying to write some user manuals and readme files, using Atari Works.

Hmm...

: If I select "Export file" from the menu, and then choose "plain ASCII", I
: get a file containing a number of _very_ long lines (200-300 characters or
: more) for each paragraph. (read: each paragraph becomes one long line of
: ASCII)

Unformatted ASCII text. Very useful when importing into a DTP program or
wordprocessor...

: Is there some source code somewhere I can use to read and translate the
: STW file that Atari Works saves its text into, into 70-ish width lines?
: Or is there a utility I can use?

Most good text editors should be able to perform a decent word-wrap to
a specified line length, AFAIK... And if not, it shouldn't be _too_ hard
to write a bit of code for that... (after all, this _is_ a programmer
newsgroup :)

: Doing so by hand, using an ASCII editor (like the one included in Devpac,
: Lattice etc) is tedious when the files get lengthy.

Erm, yeah.

Source record: 4003

Hello everyone,

I'm writing a disk utility program in GFA BASIC 3.5E. I was
wondering if anyone knows or could show me some sample code on how to do
any of the following...

(1) Read the disk FATS table and decifer it.
(2) Read how many directories and files are on the disk
(3) Read/Change the disk lable
(4) Probably some formating routines

I really need to find a rountine for the FATS table. I want to be
able to find system and hidden files. I also need to find clusters,sectors
e.t.c. Also files which have been deleted but their data is still on the
disk.

Thank's

Scott.

Use sector read routines to read the FAT.

> (2) Read how many directories and files are on the disk

Use Fsfirst-Fsnext.

> (3) Read/Change the disk lable

Read the directory sector change name write the sector.

> (4) Probably some formating routines

Use the OS format routines.

System and hidden files are found using Fsfirst Fsnext. No need
for FAT's overhere. Maybe you should first read some documentation
about the file system before even thinking about tinkering with
the filesystem. A good place to start is
http://www.komkon.org/fms/MSX/Docs/Disk.txt
which looks like a part of the ST discdoc program.

Maybe you should also browse the disk with a sector editor
so you can learn how things fit together. One of the best
dikeditors ever is (IMHO) norton diskedit. Don't worry
about it being a DOS program because the filesystem
structures are exactly the same. Try to learn about
the diskstructures with that program.

Succes, Hans Wessels

Scott Harris (harris@cs.mun.ca) wrote:

: (1) Read the disk FATS table and decifer it.

That should probably just be FAT (FAT = "File Allocation Table").

: (2) Read how many directories and files are on the disk

Easy. Just step through all the dirs recursively...

: (3) Read/Change the disk lable

Shouldn't be too hard, there's even a GFA-call that can do that IIRC.

: (4) Probably some formating routines

Check out some docs on XBIOS calls if you can find them...

: I really need to find a rountine for the FATS table. I want to be
: able to find system and hidden files. I also need to find clusters,sectors
: e.t.c. Also files which have been deleted but their data is still on the

You'll want to get at least the Atari GEMDOS manual, which has an appendix
dedicated to FAT-fs structure. It should be on most of the good Atari FTP
sites (I think Umich as wel...) or else try my page (see below, and hope the
link is still valid...)

Good Luck,

Hi!

Jos den Bekker <josdb@xs4all.nl> wrote:
: Beware! We have vfat systems nowadays, and with those Fsfirst-Fsnext
: don't work. I've just tinkered with this.

If available, one should always use Dopendir(), Dreaddir() and
Dclosedir() to scan a directory. I posted an example here some time ago.

Also note that Fsfirst()/Fsnext() on VFAT partitions with SingleTOS
(i.e. without VFAT enabled) sometimes find the VFAT entries, which is a
bad thing. There are two ways to avoid that: Put HideVFAT into your
Auto-folder (I'll make that available tomorrow), or put a workaround
into your programs, like this:

```
fret = Fsfirst("C:\*.*", 0x17);
while (fret ==0)
{
if (dta.d_attrib == 0xf) /* Is it a VFAT entry? */
continue; /* Yes, so skip it */
/* Do something with the file */
fret = Fsnext();
}
```

Ciao

Thomas

What do you mean by the sector read routines? Are you talking about
BIOS/XBIOS parameter blocks?

> > (2) Read how many directories and files are on the disk
>
> Use Fsfirst-Fsnext.

Ok I was thinking about that, but what about the directories and files
within directories. FSFIRST-NEXT only reads from the current directory, so
this means whenever the loop incounters a folder, it would have to change
to that directory and check its contents and so forth. Is there another
way? Could I use the FATS table for this purpose. Just read it and count
the file ends.

> > > (3) Read/Change the disk lable

So the disk lable is stored on a sector on the disk. So its just a read
and write routine to that sector.

> > (4) Probably some formating routines
>
> Use the OS format routines.

What do you mean by OS format routines? Do you mean XBIOS(10)?

You could do so, but of course it's nothing to use in an application,
but only in a special disk utility which checks whether the partition
it's reading from is really a FAT one.

: So the disk lable is stored on a sector on the disk. So its just a read
: and write routine to that sector.

To be precise, the disk label for a FAT filesystem is stored in the root
directory as a filename with attribute 0x8 (so, if one is set, it may be
located in any of the root directory's sectors). Simply use
Fsfirst("*.*", 0x8) (or Dreadlabel(), if available) to read it, and
Fcreate(labelname, 0x8) (or Dwritelabel(), if available) to set/change
it. No need to use low-level-stuff for that.

Ciao

Thomas

One of the first big MiNT distributions, the TAF-kit, came with X11 as default GUI. It works nicely on a 4meg ST. But lemme get this discussion straight, so far the line was that an Amiga can do anything an Alpha can do in Linux because an Amiga will run Linux as well, but that this doesn't go for Ataris because MiNT isn't fully Linux compatible? Are we forgetting that Linux will run on an Atari as well? (And, again, that X will also work under MiNT).

Maurits.

It may not necessarily go for MiNT.

That does not address Atari in general.

A Falcon will quite happily run Linux and could
quite happily contribute to a D2 render farm
right beside an Ameboa, an Alpha, a Sidewinder
or any other supported platform...

Every so often, whilst debugging some code I've written, I see the 68k instruction "cmp.w #$c9,d0" in the start of the code that handles the GEM trap.

I know that $73 signals that it is a VDI call, and $C8 is for AES calls, so what does $c9 signify?

Hi All,

I was wondering if anybody out there knows if there is a C++ compiler
for the Atari platform? I can't think of any GEM C++ compilers, but
perhaps there is a MiNT version of the GNU C++ compiler?

Thanks.

Regards,

Ben Hills.

Correct, gcc is ported to MiNT/TOS/MagiC. It's available (with libs)
from all good ftp-sites. Try 'ftp.funet.fi/pub/atari/piwo-mint/Gcc'

Source record: 4021

Hi I am having a prob (as usual) with my evnt_multi() with the
avserver message it could send me.

ok: it says here on my manual that if I put addr_buffer (in the
evnt_multi()) = 0 it will check for menu(1) to menu(8) mu_mesag.

The thing is< how do I check if I get a message from the avserver?
the ideal would be to put addr_buffer in the evnt_multi and then i
woul dbe able to check that. But then all the regular aes messages
won't be seen at all.

Clear enough?
thanks :)

Hi all,
I am thinking of adapting some existing tools (the c68/jas compiler and assembler) for a personal project, and I might also need to create a simple custom linker.
I've looked around a bit and I haven't been able to find the definition for DRI object files. Is this documented anywhere? (For Motorola 68k object code)

Thanks in advance,
-Russ Magee

```
This will read a single byte from the midi port, only if theres something
to read:

IF INP?(3)
value&=INP(3)
ELSE
value&=-1
ENDIF

The reason for using value& (word) instead of value| (byte) is, if there's
nothing returned, then value& will be -1, whereas if something is available
it will be in the range 0 to 255.

There are any number of programs that would break down the long ascii
lines for you. QED is freeware and can be set to auto wrap long
lines. Many of the standard word processors will also do it.

If I understand you correctly...
The gfa MENU(x) values are not advised when the true EVNT_MULTI is used. The solution is to link addr_buffer% to the MENU(x) table, so don't use MENU(x) but your own table such as :

```
FUNCTION ev_multi(em_flags&,em_cl&,em_ma&,em_st&,em_ct%,VAR
em_mx&,em_my&,em_mk&,em_kbd%,em_key%,em_click&)
'
INT{ADD(GCONTRL,2)}=16
INT{ADD(GCONTRL,4)}=7
INT{ADD(GCONTRL,6)}=1
INT{ADD(GCONTRL,8)}=0
'
INT{GINTIN}=em_flags&
INT{ADD(GINTIN,2)}=em_cl&
INT{ADD(GINTIN,4)}=em_ma&
INT{ADD(GINTIN,6)}=em_st&
FOR i&=8 TO 24 STEP 4
LONG{ADD(GINTIN,i&)}=0
NEXT i&
INT{ADD(GINTIN,28)}=WORD(em_ct%)
INT{ADD(GINTIN,30)}=WORD(SWAP(em_ct%))
'
LONG{ADDRIN}=addr_table%
'
GEMSYS 25
'
em_mx&=INT{ADD(GINTOUT,2)}
em_my&=INT{ADD(GINTOUT,4)}
em_mk&=INT{ADD(GINTOUT,6)}
em_kbd%=INT{ADD(GINTOUT,8)}
em_key%=INT{ADD(GINTOUT,10)}
em_click&=INT{ADD(GINTOUT,12)}
'
FOR i&=0 TO 7
menu&(SUCC(i&))=INT{ADD(addr_buffer%,SHL&(i&,1))} ! solution
NEXT i&
'
RETURN GINTOUT(0)
ENDFUNC
```

The simpliest way is to look in INT{attr_buffer%+x*2}

>The thing is< how do I check if I get a message from the avserver?
>the ideal would be to put addr_buffer in the evnt_multi and then i
>woul dbe able to check that. But then all the regular aes messages

AV_SERVER messages are like AES messages coz they use the same GEM pipe.
^^^^

The difference is that AV_SERVER message codes which are higher
(MENU(1) is over 100). See german TOS.HYP (cool developper
documentation for the codes).

Did I answer your question ?

Cheers

Hi Katherine,

i'm not sure to understand very well your problem, But it seems that you want to use
evnt_multi()
to get a specific messages from "avserver" and the standards system messages ???

In this case, there are no problems. You do a standard evnt_multi() call like
follow:

Message = evnt_multi(...)

and when a message OR any other event will occur, evnt_multi will return these
informations into Message.

to know if it is a message AND what is it you need to do:

```
if( Message & MU_MESAG)
/* This a message, standard or from another application. So you need to check
what there are
into the Array message[1..8] , passed in parameters of evnt_multi */

if( message[0] = <a message code>)
/* to what it must do ! */

else if( Message & MU_TIMER)
/* For example the GEM timer, (time elapsed) */
```

check your mail, i will send to you a source example i written... ;-))

Source record: 4029

```
Thanks to all of you :)
I finally managed to get it to work.
The prob was:
That if I put the addr buffer as argument in my evnt_multi() I
couldn't see the regular aes messages (redraw etc), Because I was
still using MENU() >>> not good ;)

So now it is fine:
evnt_multi(,,,,,varptr(msg&(0)),,,,,)

If event& and mu_mesag
select msg&(0)
case wm_topped
etc
This sheme works :)
Thanks!

on Tue 21-07-98 09:28 Thomas Binder wrote:

> if (dta.d_attrib == 0xf) /* Is it a VFAT entry? */

I suppose, if I use Fxattr(0,filename,&xattr) instead, I get this
value in xattr.attr as well?

The reason I ask this is, that under MiNT and MagiC, when Pdomain()
will be naturally set to 1, you might have a non-vfat partition, and
then Dcreate() and Dopen() don't work. I suppose this isn't hard to
remedy, since I can test for vfat before these calls, set Pdomain(0),
and again Pdomain(1) when I'm finished. Is that correct?

I suppose the same goes for Fcreate() and Fopen(). But now another
problem occurs with existing compilers and their standard libs. I have
PureC and use only fopen(). If, under single TOS, I try to open a file
with long name, e.g. X:\longnames\dontknowif\ilikethem.period, then
fopen() will find and/or open a file X:\longname\dontknow\ilikethe.per
Under MagiC or MiNT, however, fopen() will fail on a non-vfat
partition and errno says "Path not found" (this is PureC's fopen()).
Do I have to write my own fopen() now, or is there another way around
this problem?

Fxattr() yields non-0 if it can't access the file or directory, so on second thought it's not a good idea to use that as a test of the drive/partition.

Is there a good and secure way to test if a drive/partition is vfat or not?

You doesn't need this information. Also, there are other filesystem
available (MinixFS, RAM-FS).

I doesn't see any problem if you use Dopendir/Dreaddir/Dclosedir and the
new calls that support long and casesensitive/casepreserving filenames.

No. The VFAT entries are not visible for you. Only if you access the
device direct.
Also, the FAT entries are also not visible.
And, there are other filesystems available with a completly different
structure.
Your program doesn't need any information about the phyisical structure
of the filesystem.

I remember going through this nightmare about a year ago, when I
was trying to link GENST generated assembler with GCC object
files.

The closest I got was finding sourcecode for a freeware linker, but
I can't remember the name. The source for the GCC linker is also
easily available, but it doesn't support DRI or GST formats. You must
convert these to the GCC linkable format using another tool. :/

Sorry I can't help more than this. But the linkable file formats have
always been a bit of a problem on Atari - documenation wise and
availability wise.

Or - as already mentioned - if you use Fsfirst()/next() with certain versions of SingleTOS and certain search attributes. That's why there's HideVFAT for SingleTOS, which I'll upload in a few minutes to ftp.cs.tu-berlin.de

Oh, I forgot: You'll also need HideVFAT with MiNT prior to 1.15 (which is still in alpha state), because Dopendir() & Co. internally also use the Fsfirst()/next() of the underlying TOS on FAT partitions, and therefore 'find' the additional VFAT entries. This may be dependent on the TOS you're using, but it is true for TOS 4.04 at least.

Ciao

Thomas

Maybe Andreas could patch Magic for it to act as single Tos does ?

>so what does $c9 signify?
```

I've been tracing a bit in the AES lately (working on XaAES (yes, a new (much more stable and better working) version has been released (source only for the actual beta7+ so far) and can be found on my ftp site (join the XaAES mailing list if you are interested in this)) and as far as I could see, the $C9 seems to be used as a kind of AES equivalent of Syield(). That is, it won't do any work but will cause a 'task' switch if possible.

```
This was never documented, AFAIK, but it has also been used to test for
the presence of an AES, which is why you'll find it in for example the
XaAES trap code.

2028. 256 colour rgb tables

Newsgroup: comp.sys.atari.programmer
Date: 1998-07-25 00:00:00 UTC
From: matthew@peckham.cix.co.uk
Message-ID: <memo.19980725091706.215A@mcareyb.compulink.co.uk>
Source record: 4043

256 colour rgb tables
Is there a fool proof way of getting these correct. I wrote a
programette a while ago that converted Mac icons into Atari icons in
a resource file? An American user has just mailed me

> I use MagiCMac and also have an Atari TT030. I use Icon-verter
> frequently to convert icons from mac os to GEM, but I have noticed
> the B&W and 16 color icons are always fine, but the 256 color
> versions never have the correct pallette - did you perform any
> pallette mapping from the mac os pallette to the standard GEM
> system pallette?

On my LC475 with MacMagic and Ease they look fine using the RGB table
that Interface generates when it saves colour icons in RSH long
format as the Atari RGB table.

If I try to build a table using vq_colour() values it is terrible.

At present I just use a secondary program to compare the Atari RGB
table with the Mac 'clut' resource and generate a Mac resource source
file that contains a table where the index is the Mac Colour and the
data is the corresponding Atari colour. (Mac 'clut' RGB table is
expressed in values of 0-65535 while the Atari is in 0-1000).

Any ideas.

Matthew

But there obviously are problems. Under MagiC and MiNT, Pdomain() is
set to 1. But in that case, Dcreate(path) will fail if `path' is, or
contains, a name > 8 chars. But I don't want it to fail. I want it to
work as under plain TOS, i.e. with names truncated to 8 chars. The
same goes for Dopendir(), etc. So if I know I have a vfat drive or
partition, I can bracket those calles with Pdomain(0) and Pdomain(1)
calls.

Hu? I was talking about a program with Pdomain() set to 1. Surely the
vfat entries are visible then, aren't they?

But as it happens, you can have a non-vfat partition under MagiC and
MiNT as well. How do I test that?

>And, there are other filesystems available with a completly different
>structure.

Well, I don't know about those other filesystems. What do you mean?
Can they be accessed and used under MagiC and/or MiNT?

>Your program doesn't need any information about the phyisical structure
>of the filesystem.

What I want to know is: Do I have a drive/partition that doesn't
support long, and/or case-sensitive, filenames? Because if I have it,
Dcreate(), etc. fail with Pdomain() set to 1.

2032. TWAIN scanner support on TOS based systems

Newsgroup: comp.sys.atari.programmer
Date: 1998-07-26 00:00:00 UTC
From: Eon Man <eonicman@erols.com>
Message-ID: <35BAAAD9.DC39A57A@erols.com>
Source record: 4047

Anyone interested in writing TWAIN scanner support for TOS based systems (preferably through the use of Parx's M&E System Folder) can do so by downloading specification 1.7 from the TWAIN Working Group's webpage. This way, we can finally get to use those inexpensive Visioneer PaperPort scanners on our lowly Atari computers! I'd love to hook up the Mac version to my Falcon's LAN port.

>
Russ,

The DRI .o format used on the Atari ST is the same as that used on
CP/M 68K. If you go to the Unofficial CP/M Web page at

http://cdl.uta.edu/cpm

or the mirror at

http://www.mathcs.emory.edu/~cfs/cpm

you can download the CP/M 68K Programmers Reference Guide which
details this.

DRI defined several output formats for the executable, the main
ones being

CP/M 68K contigious format relocatable and absolute, magic number 601A
GEMDOS contigious format relocatable, magic number 601A
CP/M 68K noncontigious format relocatable and absolute, magic number 601B
CDOS 68K crunched relocatable, magic number 601C

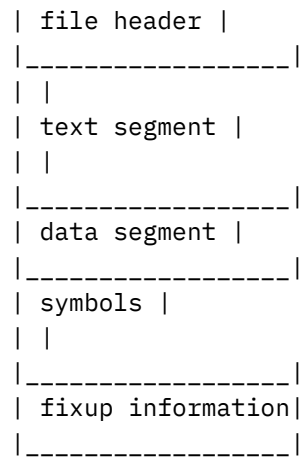
The CP/M 601A relocatable format uses one word of relocation information
for each word of code and data in the program and so produces a file which
is very big. The GEMDOS 601A uses a more compact relocation information
the following is a description of the GEMDOS 601A format from the GEMDOS
manual in the ICATARI user group magazine issue 3.

An executable file consists of a header followed by

images for the text and data segments, zero or more symbol
table entries, a fixup offset, and zero or more fixup

records:

Executable File Parts



The file header contains a "magic" number (a signature
to indicate that it is an executable file) and several long-
words containing size information:

Executable File Header

Offset	Size	Description
0x00	word	0x601A (magic number)
0x02	long	Size of text segment
0x06	long	Size of data segment
0x0A	long	Size of BSS segment
0x0E	long	Size of symbol table
0x12	long	(reserved)
0x16	long	(reserved)
0x1A	long	(reserved)
0x1E		(start of text segment)

The text and data segment images immediately follow the
header. The symbol table, if there is one, follows the data
segment.

GEMDOS will "fix up" a longword in the text or data
segments by adding the base of the text segment to the value
already in the longword. The fixup list specifies which
longwords need to be relocated. The first item in the fixup
list is a longword specifying the offset of the first fixup;

the longword is NULL (0L) if there are no fixups. Single
bytes following the longword specify offsets to more fixups.
The longwords _.m_.u_.s_.t start on word boundaries, or the system
will crash.

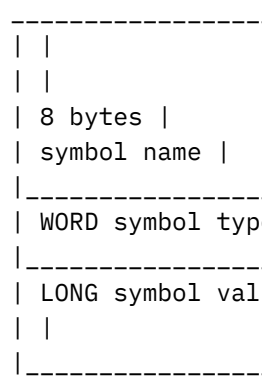
Relocation Bytes

Byte	Description
0	end of relocation information
1	advance 254 bytes, get next byte
2, 4, .. 254	fixup longword at location pointer
3, 5, .. 255	(odd numbers, reserved for future use)

Symbol Table

The symbol table consists of symbol-table entries, formatted as:

Symbol Table Entry



Values for Symbol Types

Type	Value
defined	0x8000
equated	0x4000
global	0x2000
equated register	0x1000
external reference	0x0800
data based relocatable	0x0400
text based relocatable	0x0200
BSS based relocatable	0x0100

The Sozobon system extends the symbol table types as described in the documents thet come with it.

The Sozobon linker outputs the GEMDOS format executables only and does not understand 16 bit relocation information or PC relative fixups, it assumes all address references are 32 bit. This is ok for the output from the Sozobon compiler but is not so good for handeling hand coded assembly

files.

I am currently (very slooooowly) working on a modified version of the
Sozobon
tools to allow me to use them as a cross development platform for the PC to
let me build a working CP/M 68K system when I eventually get some hardware
to run it on.

I currently have the linker modified to handle GEMDOS and CP/M 68K 601A
format output files, to handle 16 bit address references, PC relative
fixups
and to fix one or 2 bugs in the linker.

I plan to add support for 601B and 601C format files and absolute files
next.
After that I plan to look at JAS and expand that a bit.

If you want the new linker or need any more info on the DRI 68K file
formats
drop me an email to: peter at cylon dot ie.

Regards,
Peter Mc Shane

Errrm, scanner support doesn't seem to me to be something you should put in
the OS -- well, not on any non-Windows anyway... :)
The PARX modules are a better idea, as only programs that want to and
know how to use them will load the scanner interface code (pity DLL support
still isn't much on Atari... -- That would be a worthwile OS addition,
preferably using the same API as one of the existing DLL managers)

2036. vr_trnmf() problems. (4-bit to 16-bit forms conv)

Newsgroup: comp.sys.atari.programmer
Date: 1998-07-28 00:00:00 UTC
From: oskancke@online.no
Message-ID: <6pkd38fde1@o.online.no>
Source record: 3901

Hi, all. I'm trying to write my own rsrc_load() function. This routine is nearly done, except from one thing, which is what I'm asking for help about now. Right now I'm doing the 4 plane forms (color icons) to 16 plane froms. And this is where I need some help.

My problems are those; When I, after converted the icon data from 4 to 16 plane device indipendant format, use vr_trnmf() to transform this into device indipendant format, it works as it should on the Falcon (Videl, standard 16-bit motorola format, rrrrrggg,gggbbbbb). But, vr_trnmf() don't seem to work with my Crazy Dots 15-bit gfx card (which is 16-plane intel format, gggbbbbb,0rrrrrggg, where bit 0 is not used). Does this mean that vr_trnfm() don't work correctly with byte-swapped gfx modes, like the Crazy Dots?

I then did the transformation to device dependant myself, and this worked exactly as it should, so I KNOW that this problem is within the vr_trnsfm() funtion. I've been trying to read some C sources to see how they do it, and it seems to me that they are actually doing the device independant -> device dependant transformation manually, after checking what the device dependant format looks like. Now, that leads us to my question..

How do I check in a reliable way what format (byte swappted or standard motorola, 15 or 16 bit) I should use?? Any help on this matter is most appreciated.

2037. Source code for HTML2TXT v1.5 released!

I am still working on my "Toolbox" DLL engine. (started mid-1992)

It was written in 68k assembly language.

It uses 32k of RAM, runs on TOS 1.0 STs through TTs. (Falcons? Hades?)

A 68000-family CPU is required.

Libraries can be bootloaded, or loaded as needed by applications.

It supports System and User libraries.

There is support for library enumeration and interrogation.

Each library can be used by more than one application.

It can be called from the foreground application via a TRAP. Or, if you
must it can be called via a jumptable.

(Ideally, it would have been ready for public release this week, or early
next week)

Still to do: user and programmer manuals.

(No web page, URL yet)

Salut rodolphe.

Me and some friends (the CloeTeam) are working on the Version two of our 3d modeler/renderer :Cloe2.
For the instant we are only working on the pc version but i want to make the Atari version like the first version of CLOE.

But we need hands. This version of Cloe will be much much powerful than the first version and it will be freeware, but we don't have the time to make the Atari conversion. It's not so much work because it's only minor modification on our windows system. The code of Cloe is OS independant for the user interface. There is a little work to do for the plugin system. Note i think that for compatibility between vdi we need to use Nvdi because we use much more off-screen than the first version. In the first version this part of code was write in ASM but whith the new graphics mode for the Hades and the other Atari clone ot was not good. So i want pure gem/nvdi coe now.

Waiting for hands.

Cool! What kind of ethernet-adapter do you adapt? Hopefully it's
something that's easier to find than the DE600 ;-) It looks like I'm
going to get a Milan this year, so a ethernet-solution for my Falcon
is something I really need.

2043. [Q]: Object file formats needed...

Newsgroup: comp.sys.atari.programmer
Date: 1998-07-29 00:00:00 UTC
From: Konstantinos Xonis <gc85@mailserv.uni-giessen.de>
Message-ID: <Pine.GSO.3.95.980729175957.27538A-100000@sun8.hrz.uni-giessen.de>
Source record: 3908
Cross-posted to: de.comp.sys.st,comp.sys.atari.programmer,comp.sys.atari.st,comp.sys.atari.st.tech

Hi !!

I am looking for the object file formats for the different compilers on
the ATARI computers.
In particular, I am interested in the formats of
PureC, PurePascal - containing the debugging info stored in the object
file. Is there any Profiling info stored in the
object file, so that PureProfiler can work with ??
MegaMaxModula 2 - for the definition modules and the implementation
modules, also containing debug info, if applicable.
GNU C/C++/ObjC - Also need "full details" about the object files.

Any other object file formats are also greatly appreciated.
I am currently writing kind of a ReAssembler, so I need to know anything
that is available about all the object file formats available on the
ATARIs. Is the *.LOD file's format for the Falcon DSP modules anywhere
documented, or do I have to ReAssemble the Falcon ROMs to get the info I
need about ?

We're using all ethernet adapter based on th RTL8012 from Realtek. Most of
actual adapter are based on this chip (exept the DE620 and the Xircom
ones).After this one we shurely have a look to the DE620 from DLink witch
replace the DE600. We ask Dlink for documentation but they don't aswer :-((
We'll use Linux source code for the DE620 (wheras we've got data sheet for the
RTL8012 and Linux sources :-)))

>Any help, syntax or explanation is more then welcome!

You open the database file.
Click on Query.
You can then either search for free text or you can use the Expression
to fill in a dialogue box with a complex expression for the search
criteria. This is of the form:

<Field Name> <operator> <Expression>

where <Fieldname> is selected from the displayed list
<operator> (= , >, < etc)
<Expression> is built from the list of functions in the scroll box.

Expressions tend to look like expressions in Basic.

This is the plain old a.out format. See man a.out on any BSD derived
system (eg. Sun3/Sun4).

What I meant, of course was, a *non-vfat* partition. If I have a
non-vfat partition under MagiC, Dcreate() will fail with long names.
But in that case I want it to work as under single TOS. I could do
this by setting Pdomain(0) temporarily. But for that I have to know
what file system the partition has.

I haven't been following this thread in too much detail, but are you
not looking for the call val=Dpathconf(DP_TRUNC); which enquires whether
the filename will be truncated automatically or not?

val = 0 (DP_NOTRUNC): No truncation performed. Invalid filanames cause
ERANGE (-64) errors to be returned.
val = 1 (DP_AUTOTRUNC): Filenames are automatically truncated to max length.
val = 2 (DP_DOSTRUNC): Filenames are truncated to DOS 8.3 format

(what is the difference between DP_AUTOTRUNC and DP_DOSTRUNC, as this
is surely just a specific case of DP_AUTOTRUNC?)

Note that I haven't been following too closely the recent changes to
MiNT's TOSfs, but I guess this is still valid (info taken from compendium).

Also, this talks about filenames, rather than directories... perhaps this is
not respected in Dcreate()? (if so, is this an omission/bug?)

Yes, that is probably exactly what I was looking for. Never thought
of Dpathconf()! :) In any case, it returns 2 on a non-vfat partition.

>(what is the difference between DP_AUTOTRUNC and DP_DOSTRUNC, as this
> is surely just a specific case of DP_AUTOTRUNC?)

Yes, of course DP_DOSTRUNC is a special case of DP_AUTOTRUNC, but it
works differently, and it's good to know that, because you might have
(several) dots in your file or directory name.

>Also, this talks about filenames, rather than directories... perhaps this is
>not respected in Dcreate()? (if so, is this an omission/bug?)

The funny thing is, it doesn't work with Dcreate(), i.e. Dcreate
returns an error code if the name is too long and Pdomain() is set to
1. It works properly with Pdomain(0). In any case, that is the outcome
of my (brief) testing, but I might be missing something.

I'll do some further testing.

>of my (brief) testing, but I might be missing something.

Well, I must certainly correct this. I don't know what happened the
first time I tested it, but it must have been something else that made
Dcreate return an error code, because now it works as it should, i.e.
long names are automatically truncated on non-vfat partitions, whether
they be directories or files, and the directories/files are properly
created with shortened names.

2056. SCSI CDROM in falcon

Hi there

can anyone tell me how i can get my scsi cdrom (known to work fully) to work connected to my falcon.

It shows up on ahdi's initialisation but that's it. metados doesnt even work

it just gives me a drive icon that opens a window with nothing in it, the drive doesnt even read when i do refresh.

i am using hte iso9660f drivers.

any help would be appreciated.

yours

Ian Norton

Such a driver would rule, esp. if someone can get it to communicate
through TCP/IP or Windoze Networking, to communicate with PCs!

That'll be cool!

I've never had much luck with MetaDOS, especially on a Falcon (and only
marginal luck on a Mega STe). I'd advise buying Extendos, which has
worked great on my Falcon and STe.

If serial will do then my suggestion is that you use a nullmodem cable and the Z-modem transferprotocol, this is what I use myself with satisfaction. And it's free.
For the Falcon you need a comm's program or at least a good implementation of the Zmod. prot., there's some available as shareware and freeware. On the PC you can download Omen Technologies (the inventors of Zmod. prot) version from their homepage (search for it), I have chosen to use the "classic" setup since it really works. Just do a couple of switches and the setup is complete. Around 11Kb/second (660Kb/minute) with good errorchecking and "crash recovery", i.e. you can continue to send on "half sent" files. You can even unplug and replug the nullmodem during transfer and it will still work 100%.

Send a mail if you're intrested in more details.

Regards, K.Hampf

I don't know if that might be possible. I mean communicate through the
win network. Guess you'll need some sources from M$ for that... To make
a connection from a PC to the atari (using win network) can be possible
if someone would port the samba server from Linux to Mint...

You should try Spin which is more efficient than metados and able to do DDS (if
you drive can).
i suggest you to have a look at:

http://www.muenster.de/~reschke/soft_e.html

i use it on my Falcon (AB040+Magic) with a sony and it work very well....but no DDS
cause i have unkow problems with my drive...

Sure, there are the "Atari compendium" from scott sanders, in english
and a very good reference.

I know in french a old book from Micro-application "Atari's developper"
from a German edition, but i don't if it does exist in english.

Atari compendium can be found as a CD-Rom in PDF, html format.

Another correction, a final one this time, I hope. :)

After extensive testing, I must conclude that it remains a serious
problem. Under MagiC, creating one directory on a non-vfat (i.e.
(DT)OS) drive is no problem. Problems occur if you want to create a
directory tree. If C is a (DT)OS directory, then

Dcreate("C:\LONGDIRECTORYNAME");

creates the directory "C:\LONGDIRE".

If you then try to create directory "C:\LONGDIRECTORYNAME\ANYNAME",
however, it fails. This works correctly under plain TOS and setting
Pdomain(0) doesn't help either.

I can only conclude that this is a bug in MagiC. If a directory is a
TOS directory, Dcreate() c.s. should behave as under plain TOS.

Moreover, if I have a file "C:\LONGDIRE\FILE.EXT", a call of
fopen("C:\LONGDIRECTORYNAME\FILE.EXT","MODE") fails under MagiC on a
non-vfat partition, but works correctly under plain TOS.

Has anyone else encountered these problems? Are there perhaps standard
workarounds to overcome it?

Thanks for any feedback.

I don't know about any standard solution/workaround, but it might be an
idea to do the truncation yourself. At least that way you know that it's
going to work on non-vfat/vfat partitions. It may not be the best way
of doing things, but if it gets the desired results...

As others have said, the "Compendium" is the book to get hold of.

Also, you will need a piece of software called a "resource editor".
This creates the .RSC files which contain the visual elements of a Gem
program. It allows you to design the user interface and allows you to
give names to the elements of the resource file that your source code
needs to manipulate.

It is *possible* to create a resource file manually but it is very
very difficult to get right, so I don't recommend doing it this way.

The best resource editor is a commercial one called "Interface" but
(free/share)ware ones exist. Afaik most of them assume you program in
C but Interface allows you to specify other languages should this be
required. Maybe some of the others do - I dunno.

You really need a framework to write a proper event handling GEM
program with windows etc. However one that just checks for the absence
of arguments and presents the file selector with a suitable prompt is
easy enough to do. Just call appl_init() then fsel_input() then maybe
form_alert() and appl_exit() at the end.

I based my proper GEM programs on the layout of Compute!'s ST
Application Guide Programming in C, Field, Mandis & Myers. Incredibly
ancient, buggy and aimed at a version of C from the stone age. The
actual division of tasks they layout is sensible and once you have
fixed the bugs it works.

The samba-server has been ported ages ago. I can't remember where I
found it but AFAIR I still have the archive on a Zip somewhere. The
new MiNT-distribution (MiNT98) is supposed to come with samba as well.

I don't know if that code is entirelly free to get.. I started once to
search and found a few things... but I don't know if it's of use.
But I guess that must be possible with a Netware server....
But than you also have to install netware clients on the PC's...

2077. Online PD - The free internet Atari PD library

Newsgroup: comp.sys.atari.programmer
Date: 1998-08-06 00:00:00 UTC
From: Deano@zetnet.co.uk
Message-ID: <35d1e0c3.2140849@news.zetnet.co.uk>
Source record: 3942

Well it's going ahead. Online PD is a new PDL with a difference.
Instead of sending money for PD you can now download it directly from
the internet. The site is set out just like a PD catalogue and it has
download links to the software you want. Unlike Ftp sites there is no
need to wade through loads of folders to check for the software you
want - cos everything has a decent description and a direct download
link.

If you know of any good PD that I can include in the library then
please send me the info. It must be on the internet because I don't
have time to upload it anywhere.

When you send me a submission I don't mean send me the actual program.
All I want is the following info.

Program Name: (IE: Llamatron)

Program Type: (IE: Game)

Machine: (IE: Is it an ST,STE, or Falcon only program?)

Emulator Compatibilty (IE: Does it work under Pacifist?)

Program Description: (IE: Llamatron is a game by Jeff Minter and a
clone of Robotron. The object of the game is to shoot llamas etc...)

(Please supply a detailed description.)

Download Link: (IE: ftp://funet.fi/games/shoot/llama.zip)

This is a good way of getting your program noticed, or any other PD
programs you know of.

Yeah, good point, but hopefully it'll be backed with a decent Atari
network card. I think that the lack of PC-aware Atari networking is
killing the Atari, it certainly is in my house

2080. TT and IBM 540MB SCSI HDD

Newsgroup: comp.sys.atari.programmer
Date: 1998-08-06 00:00:00 UTC
From: Barrie Capel <barrie@bjcg.u-net.com>
Message-ID: <35CA2B05.2D1A@bjcg.u-net.com>
Source record: 3945

Anyone help a new TT owner connecting a hard drive?

I have bought a 540MB IBM DALS-3540 SCSI hard disk and although it appears in the partition table as device 6, when I try to format it, I get a message saying that the TT does not support this drive and I need to update the WINCAP file.

Can anyone please tell me where I can get an updated version of this file?

Best regards...

Barrie Capel

2081. GFA Basic For TT

From: Barrie Capel <barrie@bjcg.u-net.com>
Message-ID: <35CA2BC2.1B43@bjcg.u-net.com>
Source record: 3946

Can any GFA programmers out there tell me which version of the GFA Interpreter runs on the TT in TT mode please?

I have an original V3.5E, but it will only run on the TT when the TT is in one of the ST modes.

Is the TT compatible version later than 3.5E?

Best regards...

Barrie Capel

Thaught there were a few MiNT drivers available for some ethernet
cards/adaptors. And about what I've heard there are everywhere ppl who
are developping or porting drivers and ethernet interfaces... hopefully
they will continue and will have results pretty soon...
At the moment there is no easy way to connect your atari to a
heterogenious 10baseT ethernet network. That must change.
I think it looks pretty good this time... but who am I :)

It is Belgian.... but I meant real beers, not just Stella or Jupiler ...
we have thousands of them... ...a real Belgian beer like Palm or
Rodenbach or Chimey...

Greets,

Does your SCSI interface include a real-time clock? It's often
hard-wired as device 6.

Not sure of the difference between the DSAS and the DALS (my DSAS came
out of a Mac). I had to do a bit of fiddling with the jumpers,
principally the ones which controlled Unit Attention and Target
Initiated Synchronous Negotiation.

Have you got a data sheet on the drive? You could ring IBM on
01705-561000 to get one.

What driver are you using? Some of these modern drives require a
modern driver (HDDriver or CBHD).

>Can anyone please tell me where I can get an updated version of this
>file?

Hmm ... I wouldn't know what to do with a WINCAP (wear it?!) if I had
one :-)

I have the shareware GFA-compatible compiler MLINU_TRQ which is to
3.5E specs and runs fine on this m/c in TT med.

Oh, whoops, it's the interpreter which is causing trouble isn't it.
MLINU doesn't have one of these.

I'm trying to write an animator in GFA Basic (makes Animated pictures)

I've got an idea of how to do it, but I need a short/quick way to read
co-ordinates in the file, rather than do this:

```
OPEN "I",#1,a$ ' The a$ string is the file
LINE INPUT #1,text$
IF text$="1" ' the x co-ordinates in the file
a=1 ' made into a number string
ENDIF
IF text$="2"
a=2
ENDIF
.
.
.
IF text$="300"
a=300
ENDIF
```

And the same with the y co-ordinates

Precisely.

> This was never documented, AFAIK,

Also correct.

The $c9 opcode has been in all versions of GEM integrated in TOS, as well as
NAES and MagiC. It is not present in Geneva. It is used by STinG to allow
AES taskswitching while a potentially blocking STinG call is excuting. I've
been able to tell that people run Geneva when they complained STinG clients
would block task switching :-)

This call which people used to call _appl_yield() (as opposed to appl_yield()
which is a proper AES ($c8, that is) call and which only exists in PC-GEM)
is quite handy in library-like code. Reason is the following.

Library code is meant to be called by some application. If a library call
needs extended time for execution, AES multitasking won't work anymore since
it is cooperative multitasking, and the library code needed to relinquish the
CPU to the AES regularly. The library call cannot simply call evnt_timer (0);
as such a true AES call needs at least the address of the global array of the
calling application to meet the binding requirements of AES. Luckily there is
_appl_yield(), it can be called inside the library code as it does not need
any parameter the value of which the library won't know.

Calling it does no harm with Geneva, it just means that during execution of
that blocking call multi-tasking is suspended, just like it would anyway if
the call had not been called in the first place.

Cheers Peter

VAL(text$) changes the string into a number. So you just go :

```
a=VAL(text$)
```

In the Radio Play it's mentioned just before Zaphod and Ford fall out of
the cup in the sky of a strange planet.

Then later on at the end, when Arthur nicks the Heart of Gold, Zaphod
says "Holy Belgium Man!".

That's not a question of MetaDOS. It only depends on the BOS driver,
which has to do the communication with the device.

As it has been said before, check out SPIN!

Hi Tony,

> ANYONE ELSE!!!!!!!! :)

Author: John Richardson
Title: Breakneck
Target: All Atari computers
Type: An automated nodelist processor for fidonet technology
networks. The advantage of this software over other
offerings is that it is fully MAGIC compatible.
WIP: Beta stage is now completed. Release version is due out
shortly. This is a free product.
WEB: N/A, but the latest beta release is available from all Atari
BBS's who take the FANfiles network.

I've half written a replacement for Nodediff which also has trouble
running
under Magic. I don't know if I'll ever get around to finishing it
though, I
don't think there is enough interest.

John.

> >
> >And the same with the y co-ordinates
>
> VAL(text$) changes the string into a number. So you just go :
>
> a=VAL(text$)

How about using a simple loop to read and convert the co-ordinates...

OPEN "I",#1,file.name$ !Open the file
REPEAT !Start the loop
LINE INPUT #1,X$ !Get the x-coordinate - These must read in the same
order as the file
coordinates are saves (X
first, Y next)
LINE INPUT #1,Y$ !Get the y-coordinate
x=VAL(x$) !Convert x coordinate to a varible
y=VAL(y$) !Convert y coordinate to a varible
UNITL EOF(1) !This repeats until the end of the file is reached

You could also change the loop so that it ends in a particular area within
the file. I.e, UNTIL y$="END" or you could use UNTIL x=0 AND y=0. This is
sort of decission making but must be set to what ever tag the file uses
to say "yes all coordinates are read".
```

Also if your file has many coordinates whay not put them in an array.
Before the loop you could set the array by...

```
DIM x.crd(number.of.x.coordinates)
DIM y.crd(number.of.y.coordinates)
```

Then in the loop use and increase varible like INC loop. Here is an
example of how this would work....

```
OPEN "I",#1,file.name$ !Open the file
DIM x.crd(number.of.x.coordinates) !Set the x-coordinate array
DIM y.crd(number.of.y.coordinates) !set the y-coordinate array
CLR loop !Clear loop counter
REPEAT !Start the loop
INC LOOP !Increase the array counter
LINE INPUT #1,x$ !Read the x-coordinate
x.crd(loop)=VAL(x$) !Store the coordiante in array
LINE INPUT #1,y$ !Read the y coordinate
y.crd=VAL(y$) !Store the y coordnate in the array
UNTIL EOF(#1)
```

Remember the coordinates are stored in the arrays starting and number 1
not 0. These line inputs must again be placed to read in the same order as
the coordinates were saved to the ani file.

The coordinates could then be read with a simple loop like this...

```
CLR y.loop !Clear the y loop read varible
FOR loop=1 TO number.of.x.coordinates !Loop for all x coordinates
x=x.crd(loop) !reads the x coordinate from array
INC y.loop !Increase y array counter
IF y.loop<number.y.coordinates !Make sure not reading beyond array
y=y.crd(y.loop) !Read y coordinate from array
ENDIF
NEXT loop !Loop back if not all read
```

Remember the loop varible must be set according to the largest amount of
coordinates. I.e if there are a less number.of.x.coordinates than the y
coordinates, then loop should equale number.of.y.coordinates and INC
y.loop should change to INC x.loop.

Well hope this helps and is not over explained...

Scott.

Hello all,

You can find the number of bits in a FAT in the boot sector strcuture. All informations are here, number of bits, first sector of FAT, FAT length, curter lenght, ...

In GFA Basci , simply use the XBIOS or BIOS function to read the sector (boot sector and after FAT sector) and acces with WORD{} or like.

Bye.

What about testing for the existance of one ore more files in a directory ? I need a function (ttp program to be called from batch files) that can accept a wildcard as an argument and test for files in the actual directory that match it and return the corrisponding value, maybe the number of files found. This should work with TOS, MagiC VFAT or not.

I need it because I found that Okami Shell (any update) I used for my batches is corrupting the MagiC system, and want to use only MCMD that seems to be the only working CLI. MCMD is simple but you can always call external TTPs like Mupfel Tools, but I did not find a "file EXIST" function. MCMD "IF EXIST" does not accept wildcards. Is there something working, what is your favourite CLI for batches ?

I think I can do it with Lattice C and findfirst/findnext functions, but I want to be sure about longnames.

In the end I just want to tell you that I need this to program NODELIST/NESTLIST compiling on my system, what I was doing with okami CLI before was:

```
IN=D:\INBOUNDP
movetog()
{
FILE=$IN\$1
if [ -f $FILE]
then
mv $FILE C:\FILES\TESTI\
else
echo $FILE not found
fi
}
#movetog HUB.600
#movetog NET.333
cd D:\INBOUNDP
if [ -f REGION33.??? ]
then
cd D:\nodelist\
zip.ttp -xo D:\INBOUNDP\REGION33.z*
cd D:\INBOUNDP
# movetog REGION33.ZIP
else
echo REGION33 not found
fi
cd D:\INBOUNDP
if [ -f NESTLIST.??? ]
then
cd D:\nodelist\
```

```
lharc.ttp x D:\INBOUNDP\NESTLIST.*
cd D:\INBOUNDP
# mv NESTLIST.* C:\FILES\TESTI\
else
echo NESTLIST not found
fi
cd D:\INBOUNDP
if [ -f NODEDIFF.??? ]
then
cd D:\nodelist\
arc.ttp xo D:\INBOUNDP\NODEDIFF.a*
zip.ttp -xo D:\INBOUNDP\NODEDIFF.z*
cd D:\INBOUNDP
# mv NODEDIFF.* C:\FILES\TESTI\
cd D:\nodelist
rm *.bnl
exec applylst.ttp -clean
exec btnc.tos
# rm D:\FILES\TESTI\NODELIST.ZIP
# zip.ttp -a D:\FILES\TESTI\NODELIST.ZIP D:\QBBS\NODELIST\NODELIST.*
else
echo NODEDIFF not found
fi
```

This was run just before Jetmail import TIC files.

So, how does one call _appl_yield()? Is it just

```
_appl_yield:
move.w #$c9,d0
trap #2
rts
```

Are there any restrictions on calling it?

Is it OK from a TOS app?

Is it OK from User mode, or does it require Supervisor mode?

Assuming other tasks aren't resource hogs (CPU/disc etc), how quickly will
I get control again? If all other tasks are idle, I'd assume it'd be
pretty much immediately.

Given a loop of the form:

```
for a = 1 to largenumber
do some processing
if (a mod 100) equals zero ; remainder( a / 100 ) = 0
_appl_yield() ; yield to other processes every 100th iteration
end if
next a
```

will this be OK? (please forgive my pseudo-BASIC pseudocode)

I am. Somewhere...

>You could also change the loop so that it ends in a particular area within
>the file. I.e, UNTIL y$="END" or you could use UNTIL x=0 AND y=0. This is
>sort of decission making but must be set to what ever tag the file uses
>to say "yes all coordinates are read".

Well, yes. I'm just reading 3 lines using LINE INPUT 3 times.

>
>Also if your file has many coordinates whay not put them in an array.
>Before the loop you could set the array by...
>
>DIM x.crd(number.of.x.coordinates)

[snip]

I lost it there. Thanks anyway

>
>Well hope this helps and is not over explained...
>

It *does* help, you give me ideas. The array bit lost me. I just "pick
up" GFA and never really learnt it.

Thanks

I recommend using Mupfel (http://www.muenster.de/~reschke/soft_e.html).
It's a Unix-style shell with an sh-compatible syntax.

For example, to test for a file's existance, you'd use:

```
if [ -f fileordir -o -d fileordir ]
then
echo File/directory exists
else
echo File/directory is missing
fi
```

Anyway, a CLI like MCMD, which isn't capable of expanding wildcards
itself, IMO isn't worth using. Also, it won't work with the Mupfel tools
if you use wildcards, as those expect the shell to expand them - which
is a good thing as it saves code, and prevents different behaviour of
programs due to errors/differences in the wildcard matching routines.

> I think I can do it with Lattice C and findfirst/findnext functions,
> but I want to be sure about longnames.

For that, get the MiNTlib (current is PL49, IIRC) and use it's
POSIX-compliant functions opendir(), readdir(), closedir(), and (to name
all) rewinddir(). Also, get Rich $salz's globbing routine for the
wildcard matching - but note that you'll need to adapt them a little as
at least the versions I found on the net sometimes scan over the end of
the pattern or the matched string, which might cause your program to
crash with memory protection enabled.

Ciao

Thomas

Why don't you use Mupfel? It certainly works under MiNT and MagiC...

How can you say GFA is crappy if you've never used it? I would choose GFA over STOS any day Mr. Greenwood :)

Anyhow I believe a varible can be read from a file by using the INP(#n) command. LINE INPUT cannot do so because it is only used for strings. The only fault with the INP command is it only reads one byte at a time which can take quite long for large files.

Here is an example...

```
OPEN "O",#1,file.name$ !Opens the file
ERASE temp() !Make sure array is cleared
DIM temp(LOF(#1)) !dimension the array
For loop=1 to LOF(#1) !Start loop to read entire file
a=INP(#1) !Get the byte
temp(loop)=a !put it the array
NEXT loop !Loop for all bytes
```

I'm not sure if this will work correctly though. I'm not sure the INP command increases to the next byte of the file. It does'nt hurt to try though. I'm sure GFA has other ways of read varibles/integers from files but I cannot recall them as of now.

Oh and Tony LOOK NO LINE NUMBERS :)

Scott.

GFA _will_ input a number directly into a numeric variable, if you use the
correct code for it. The problem is Clair is using LINE INPUT instead of
INPUT. The former reads a line into a string, whereas the later will input
data of the type required for the variable. ie. a string for i$ or a number
for i&, i%, i# and i|. Of course if the data being read is a number, and
the type is a string, it will be read (in)correctly, whereas the program
will give an error if it tries to input a string into a numeric variable.

You can't use LINE INPUT #1 for numeric variables, although you can use:

INPUT #1,text

to get the values required.

>>
>>thus text holds the number,
>
>No, it doesn't work, I think because the line is text, and you can't
>convert a normal string to a number string!

No, it doesn't work because the LINE INPUT is for inputting a line of text.
The LINE is added so that any ','s are not used as seperators in the INPUT
line.

>
>>
>>You would probably use a different name.. but the concept is to input
```

>>as a variable, no need to do it as text and convert..
>>
>
>That can't be done.

If you drop the LINE from LINE INPUT it will/should work. Of course there's
also the format of the file you're reading from. If it's just a list of
numbers, generated by using something like:

```
OPEN "O",#1,"FILENAME"
FOR i=0 to 319
FOR j=0 to 199
PRINT #1,j
NEXT j
NEXT i
CLOSE #1
```

the file can be read using INPUT #file|,numeric.variable whereas if you
used:

```
OPEN "O",#1,"FILENAME"
FOR i=0 to 319
FOR j=0 to 199 STEP 2
PRINT #1,j,j+1
NEXT j
NEXT i
CLOSE #1
```

you can't.

Source record: 3978

Hi again everyone.

I was reading some information on ST disk structures and found
that the dirctory sector is what holds the information about files on the
disk. On floppies it is on sectors 11 through 17 (7 sectors long), and on
hard disks is 16 sectors long.

Does anyone know how to read these sectors into a buffer and then
access the buffer in 32 byte segments. Each directory entry id 32 bytes
long and there are 16 entries per sector. Therefore I need to read in all
the directories into a buffer and access it in 32 byte segments. Within
this 32 bytes I must then again access 0-7 bytes for the file name, bytes
8-10 for the extention name e.t.c.

any ideas or routines in GFA BASIC would be greatly appreciated..

Scott.

What do you wanna do there ? You're messing with stuff deep in the
operating system, which should definitely be avoided unless you write
some rare system tool. So what is it that you want, and for which it is
not enough to use GEMDOS functions ?

The root directory does *not* always start on sector 11 (virtually never
on my disks), especially not on hard disks. And it's neither always 7
sectors long on disks, or 16 on hard disks.

Cheers Peter

I'm wrinting a disk utility/tool and want to find out how many hidden,
system, read only, files are on the disk without having to use FSNEXT.

Also I want to be able to read in the fats table to trace file contents,
i.e file data is stored in sector 1,4,8,9. I'm trying to write a utility
to undelete files, defragment disks, e.t.c.

> The root directory does *not* always start on sector 11 (virtually never
> on my disks), especially not on hard disks. And it's neither always 7
> sectors long on disks, or 16 on hard disks.

So how would I be able to determine on where this starts then? All
docmentation I have states the disk layouts are....

Sector Length in sectors
0 Boot Track 1
1 - 5 First FAT 5 (41 on hard disk)
6 - 10 2nd FAT 5 (41 on hard disk)
11 - 17 Directory 7 (16 on hard disk - may vary)

With the extended FATS length on hard disks, the directory sectors mus
also move ahead.

I need to read in the directory sectors, break it down into 32 bytes of 16 entries (512 bytes/sector) then from those 32 bytes retrieve this...

What It is Bytes

File name 0 - 7
Extention 8 - 10
Attributes 11
Reserved space 12 - 21
Time stamp 22 - 23
Date stamp 24 - 25
Staring Cluster 26 - 27 (an integer)
Length (bytes) 28 - 31 (a 4 byte integer)

All this totals 32 bytes. I need to do this 16 times for each sector in the directory. The attributes hold...

Bit 0 read only
bit 1 hidden
bit 2 system
bit 3 volumn lable
bit sub directory
bit archive bit
bits 6/7 not used

These are what I need to retrieve.

Scott.

```
The Radio Play takes a completely different direction to the books,
basically after the prehistoric Earth bit.

The books were based on the BBC Radio Play y'know. The Radio Play is the
original. Also very funny :->

g> at least the versions I found on the net sometimes scan over the end of
g> the pattern or the matched string, which might cause your program to
g> crash with memory protection enabled.

I hope this works with Lattice.
I am now using this small program I did yesterday:

#include <stdio.h>
#include <tos.h>

int main(argc, argv)
int argc;
char **argv;
{
DTA d;
int r=0;
Fsetdta(&d);
if (!Fsfirst(argv[1], FA_SUBDIR))
do{
if (d.d_attrib!=FA_SUBDIR)
{
r++;
}
}while(!Fsnext());

return r;
}

This simple program returns the number of files matching the wildcard passed
as argument (parameter) in the current directory, I just need to adapt it
for the VFAT environment.
```

Hi !
I need, in my rsc editor, to select a font style for objects.
I know that there are severals of font selector and I want to
try to call them (i.e : XUFS, or the thing's font selector).

The only documentations I manage to find were in german,
so I ccnt understand anything.

Could one of you help me either finding english documentation
or explaning me how to call the fontselector.

Note that I use assembly language but I understant C.

Thanks.

Well. Read the AHDI release notes. They should tell you how to read the
BPB (and what's in there). They will also make you aware that the
logical
sector size is not necessarily 512.

>6 - 10 2nd FAT 5 (41 on hard disk)
>11 - 17 Directory 7 (16 on hard disk - may vary)

Hmm, looks like the docs are quite old then. Here's how to work out how
many sectors are used by what in GFA basic, since that's what you're using.

*****

DIM b|(16384) ! buffer to hold a sector
' has to be this big to handle very big hard drives. See below for more info
'
b%=V:b|(0)
~BIOS(4,2,L:b%,1,0,device&) ! read boot sector into RAM
' use the BIOS to read boot sector
'
sectors&=256*b|(&H14)+b|(&H13) ! number of sectors on the disc
numsec&=b|(24) ! number of sectors per track
sides&=b|(26) ! number of sides of the disc
numfat&=b|(16) ! number of FAT tables
tracks&=DIV(sectors&,MUL(numsec&,side&))
'
space%=sectors&*256*b|(&H0C)+b|(&H0B) ! Total formatted disc capacity

*****

Even with the above to get you're still going to need to know whether to use
12 or 16 bit FAT decoding. For this you would need something like:

*****

bpb%=BIOS(7,device&) ! get the BIOS parameter block
secsize%=INT{bpb%} ! sector size in bytes
clsiz&=INT{bpb%+2} ! cluster size in sectors
clsizb%=INT{bpb%+4} ! cluster size in bytes
rdlen&=INT{bpb%+6} ! directory length in sectors
```

```
fsiz&=INT{bpb%+8} ! FAT size in sectors
fatrec&=INT{bpb%+10} ! start sector of second FAT table
datrec&=INT{bpb%+12} ! start sector of first data cluster
numcl%=INT{bpb%+14} ! number of clusters
fat16!=BTST(INT{bpb%+16},0) ! TRUE if 16 bit FAT, else FALSE
```

*****

```
>With the extended FATS length on hard disks, the directory sectors mus
>also move ahead.
>
>I need to read in the directory sectors, break it down into 32 bytes of 16
>entries (512 bytes/sector) then from those 32 bytes retrieve this...
```

That will work for floppies, and partitions below 16Mb. It won't work for larger hard drives. With a hard drive the logical sector size, which is what you'd be accessing, varies according to the size of the partition. What you end up with is something like this:

Sector size (bytes)	Maximum Partition size (Mbytes)
512	16
1024	32
2048	64
4096	128
8192	256
16384	512

The above depends on the partitioning utility. I don't know about the ICD software, but HD Driver is cabable of doubling the maximum size of the partitions with TOS 1.(0)4 and later.

Anyway before I start rambling on, the above should give you some help.

No offense, but do you really think it's a good idea to write such stuff
if you even don't know how to determine vital data of a disk/harddisk?

Also, there are already a lot of programs which allow undelete and/or
defragmentation (Chkdisk3, Diamond Edge, Diskus, to name just a feq), so
why do you need that?

> So how would I be able to determine on where this starts then? All
> docmentation I have states the disk layouts are.... [...]

Use Getbpb() for that. It tells you everything you need to know. If
you're able to read German, you might take a look at the sourcecode of
CheckFat (it's included in the distribution, look for cfat_r4.lzh).

> Bit 0 read only
> bit 1 hidden
> bit 2 system
> bit 3 volumn lable
> bit sub directory
> bit archive bit
> bits 6/7 not used

Bit 6 is used by MagiC and MiNT's new FATFS for symbolic links. VFAT
additional entries for the long filenames have all 8 bits set, i.e. the
attribute is 15.

> These are what I need to retrieve.

You also have to remember that all information that require more than
one byte are stored in Intel-order, i.e. least significant byte first.
That applies to directory entries as well as to FAT entries.

Ciao

Thomas

For English documentation on how to use the font protocol (which is used by Thing), get the English version 1.09 of Thing from InterActive's homepage (http://www.cix.cok.uk/~inactive/), the hypertext documentation contains what you need.

> TITLE
> WEB PAGE
> CONTACTS
> SCREEN SHOT
> ANYTHING.....

Well the game is going to be a city wide chase type. No screen shots or anything yet because I'm still working on graphics problems which I cannot figure out :)

This disk utility is going to be able to (hopefully), defrag disks, format disks, copy disks, and undelete files. Also If your IBM has problems reading A ST formated disk, I'm trying to write a routine to change specific bytes on the ST disk to allow the IBM to read it.

Yes I know there are tons of these around but I'm doing for my own experience. What better way to fully understand how the disk BIOS/XBIOS work other than experimenting with them.

I also wrote a DATA BASE program with catagory references and the such. The program is a point and click interface with ZEST buttons. It is a type of freeware program. The program does have to be registered but its registration is FREE. All the user has to do is send me E-Mail and I'll send them back their own personal code to unlock all the program features. They will also recieve the code. I done it this way so I can keep track of ho many people are using it. This will help me to determine if the program is worth putting the time and effort into updateing it. Anyhow, this program is not in any ftp sites that I know of. I did file tag it here one time but only had one responce. If anyone else wants to give it a try Just E-Mail me and I'll send you copy. Then again Tony if you want a copy for the magazine I could send you a copy as well.

Scott.

You shouldn't base your opinions on others opinions without first
experiencing the language for yourself. If someone said million dollars
was a crappy thing to have and you had been offered a million dollars,
Would you turn it down :)

> >OPEN "O",#1,file.name$ !Opens the file
> >ERASE temp() !Make sure array is cleared
> >DIM temp(LOF(#1)) !dimension the array
> >For loop=1 to LOF(#1) !Start loop to read entire file
>
> tut tut...should start at 0, especialy when using an array...

Hey the person is only new to GFA so I did'nt want to confuse them right
off the start. Also real programmers usually leave in 0 index free in case
they want to use a checking string/varible in there to test if it is
really their file type :)

> > > a=INP(#1) !Get the byte
> > temp(loop)=a !put it the array
> >NEXT loop !Loop for all bytes
>
> f$="filename"+chr$(0)
> if exist$(f$) then open in #1,"filename" else error sub
> dim temp(lof(#1))
> For loop=0 to LOF(#1) :input #1,temp(loop):next
>
```

> LOOK..Less code AND file exist error checking :.. hahaha

```
@test.file(file$)
If test!
@read.file(file$)
endif
END

PROCEDURE(filename$)
test!=exist(filename$)
RETURN

PROCEDURE read.file(file.name$)
erase temp()
Open "I",#1,filename$
dim temp(lof(#)1)
For loop=0 to lof(#1)
Input #1,temp(loop)
Next loop
CLOSE #1
RETURN
```

Now mine will read all files as long as i send the file name to read file() procedure. Being able break a program down into procedure and using lable names for the procedures makes it easier to bug test and call :) There is nothing worse than always haveing to remember what line number you started a procedure in and then calling it by GOSUB 1540 :) what happens if you accendently go 1540 in STOS. There goes the line and you have to re-write it after you remember what it was. It is very hard to delete lines in GFA by human error :) And yes Tony I know you can set uf procedure lables in STOS but the must be like read.file=1000 and called like GOSUB read.file. This still don't eliminate the cahnces of deleteing or overwritting a line, nor does help debugging processes. You still have to remeber waht line read.file is on :)

> the above shorter routine will work

Mine should work too.

> the problem was that someone told me you cant , hence my comments:)

Like I said before base your opinion on experience not assumption :)

> >Oh and Tony LOOK NO LINE NUMBERS :)
>
> and your point is ?..... ho are you suggesting you can't load a file
> if you use line numbers?...or perhaps you are suggesting it .... well
> what ?... what is the significance of having no line numbers?..

I guess you must have read my big spull on this from above, If you want a copy of my book its $29.95 and there's no table of contents because I don't believe in page numbers either :)

Anyhow believe it or not I do like STOS, I think it is a great simple to learn programming language. Alot of the command names actually refer to what they do such as ZOOM. I'm just having a hard time sticking with it.

> Anyway Scott we better make a run for it before the knitting class get

I've already got a routine to read the boot sector. This gives me
information about the disk format. I need to find information about files
on the disk. This is in the directory sectors.

Thanks for the responce though.

Scott.

Ok I got the BPB part because I've already got a routine for that. It tells you where the FATS and stuff starts and you can determine where it end by add the number of sectors it uses. The routine I use also states how large the sector size is. Is this waht you mean. It returns the number of bytes per sector the disk contains.

Scott.

Yes, that's it.

> Are there any restrictions on calling it?
>
> Is it OK from a TOS app?

From a TOS program, you must be aware that people might want to start the
program without having any AES installed (for instance, having MiNT started
a CLI from MINT.CFG). I do not know what is done by TRAP #2 before AES is
installed, so this is a potentially dangerous situation.

However, if you can be sure that AES is there, you can call it from a TOS
program too.

> Is it OK from User mode, or does it require Supervisor mode?

From my experience, it works in both cases.

> Assuming other tasks aren't resource hogs (CPU/disc etc), how quickly will

2131. Lost message...

Newsgroup: comp.sys.atari.programmer
Date: 1998-08-17 00:00:00 UTC
From: Scott Harris <harris@cs.mun.ca>
Message-ID: <Pine.BSF.3.96.980817012845.28477B-100000@ganymede.cs.mun.ca>
Source record: 3849

Someone wrote me a message yesterday I think. They stated the information I have on the disk formats is outdated. They then continued to explain how the new disk formats are layed out and how to access them. Well something went wrong with my server and I lost some of the messages. This particular message I wanted to download and save and of course was one of the ones that got chucked. Could this personplease send it again if possible.

Scott.

> the call had not been called in the first place.

So, how does one call _appl_yield()? Is it just

```
_appl_yield:
move.w #$c9,d0
trap #2
rts
```

(I haven't delved too deeply into the GEM trap vector)

Are there any restrictions on calling it?

Is it OK from a TOS app?

Is it OK from User mode, or does it require Supervisor mode?

Assuming other tasks aren't resource hogs (CPU/disc etc), how quickly will
I get control again? If all other tasks are idle, I'd assume it'd be
pretty much immediately.

Given code of the form:

```
appl_init()
do GEM stuff
appl_exit()
...
for a = 1 to largenumber
do stuff
if (a mod 100) equals zero ; remainder( a / 100 ) = 0
_appl_yield() ; yield to other processes every 100th iteration
end if
next a
...
```

will this be OK?

(Just thinking aloud)

From: Olivier Landemarre <Olivier.landemarre@utbm.fr>
Message-ID: <35d81b9a.0@news.utbm.fr>
Source record: 3997

Hello

I have already seen a version of GCC 2.8.1 working under Mint, but it don't looks work on TOS or Magic or MagicMac unfortunatly, there is it a version which could work on TOS? for the moment I can use only GCC 2.5.8.

Thanks
Olivier

No offense taking.

Well what better way to learn. I'm doing it for experience and I find
hands ist he best way. Reading about what everything does and
understanding it is different than seeing why it does it and making it
do it.

> Also, there are already a lot of programs which allow undelete and/or
> defragmentation (Chkdisk3, Diamond Edge, Diskus, to name just a feq), so

Refer to what I said above. What about if we only had one of everything in
the world. One STOS program with no new add ons, one art package, e.t.c.
If we only had one of everything none whould have the right to choose :)

Still not fully sure of all this yet, but working on it.

2138. BETA testers SOP?

Newsgroup: comp.sys.atari.programmer
Date: 1998-08-18 00:00:00 UTC
From: Ken Macdonald <macdonald@cfcsc.dnd.ca>
Message-ID: <35D97977.FA20D7D7@cfcsc.dnd.ca>
Source record: 3853

Salut:
I sometimes volunteer to do beta testing, but as of yet I've never been
told what the programmer I am beta testing for wants!!
odd and irksome.
so tell me, if you ask for beta testers for feedback, what is it that
you as a programmer are looking for?
I have a registered Profile2.2, are there other system programs that
would give you important feedback?
is there a Standard Operating Procedure that a beta tester can use?
or is there a prg that would run in the background keeping track of
system calls etc and writing the info to a text file upon a crash! :-)
So far I have been just writing down what happens when a prg does a
crash or something unexpected; along with a Profile2.2 report.
Is it good enough?

hi all

i am 50% through the production of my new site,

it aims to decrease the time it has taken me to
find some software for my falcon, including magic
specific or enhanced applications,

the site will include all the software i have found
useful (shareware+pd) that i have downloaded from
different sites and hard to get english versions
and translations.

it's not finished yet but is coming up on 150 different
items, most of which will be for direct http download,
the rest are links to the authors/supporters site where
more can be found out.

stand by for more info!

ian norton :)

hi ken.
I will just speak for myself, as I know that other programers will ask
a total different thing.
in my opinion, Just the fact that many betatester try a version is
good, because of the different computer/os, setup, auto order, special
tsr, acc etc.
When a betatester experience prob. I hate a simple: "Version x.xx
doesn't work. it crashes!"

What I expect is a small report, on When does it crash exactly? is it
random? What is the message when it crashes? What kind of crash?
When it crashes, can you reproduce it under another OS? fastram
settings? memory protection? Those kind of things are normally done
directly by the user trying to get the sofware stable.
Example, I have few prog I know what to do and NOT to do to not crash.
This really helps me.
Also a report of the exact auto folder order, or acc.
anyway that's basically how I see it.. probably many other things I
forgot.

Thanks a lot it was the version I have, I have find the bug so it work
now. For information if with GCC I don't use an optimisation option it
don't work. It's not a problem but it was difficult to find!!!

regards

Hi!

ABISource have launched an "opensource" project, it's currently a Linux
and WinNT project, but... I woudn't mind if someone would like to port it
to Mint or TOS...

More info on:
www.abisource.com

But someone may say, "Oh no, not another hoax project. Remember that Mac
OS that turned out to be a copy of Linux source files". I'd like to quote a
message posted on Slashdot, "AbiSource is primarily people who worked for
Spyglass, Inc ". Well, I think those guys know what they are doing. Atleast
they have a pretty cool logo.

Regards..

//Kent Johansson

Ken Macdonald (macdonald@cfcsc.dnd.ca) wrote:
: I sometimes volunteer to do beta testing, but as of yet I've never been
: told what the programmer I am beta testing for wants!!

There are several reasons why it's helpful to have other people testing your software.

Often the author of the software knows what should and should not be done with the software, and fails to test other possibilities. An other person who is unfamiliar with the software will try out operations that the programmer would never have thought of, and often show up bugs that way that the programmer would never have noticed.

The other aspect is getting the software tested on many different computer configurations. By getting a number of people to test the software, you will find out when the software doesn't work on more unusual hardware or software configurations, or configurations that the programmer didn't think of trying or was unable to try himself.

And finally, it is also very helpful to get feedback on the design and documentation of the program. Although what usually happens here is that you have to make compromises and you cannot please everyone, the suggestions from various people are always useful.

So what should a beta tester do? There are several approaches which are all relevant. Firstly, don't think "I'm beta testing this software, what have I got to do?" but rather, simply use the software in the way that you would do if you weren't beta testing it. Pretend you're an ordinary user who simply wants to get things done with the software. Then when you notice inconsistencies in the software's operation, or crashes, or if you see any areas which could be improved, make a note of it.

Secondly, deliberately do stupid and/or unusual things with the software. For example if you were beta testing a word processor, try loading a binary file into it. Try typing unprintable characters. Try cutting and pasting a spreadsheet document into it, even though you know it doesn't support this. Try editing really huge files. Try loading text files of other formats that the software doesn't recognise, and check that it shows a friendly warning message instead of crashing or behaving unpredictably. Try choosing menu options even if they obviously do not apply to the present situation. Try clicking on all the objects in the program even if you know they're not meant to do anything. Check that the program behaves sensibly when you try to save to a disc which has insufficient free space, or when attempting to load a file that doesn't exist (the program might show a friendly "That file does not exist, do you want to create it?" message).

All that is not very good, however, if the programmer only gets messages like, "I tried the program out and it crashes sometimes." Or, "The buttons don't work properly when you press them." Instead say something like, "While using the word processor on an Hades 040 machine under MultiTOS, I selected the "Save" menu option while no document was loaded, and the program crashed with 7 bomb icons on the screen. The failure is consistent and can be reproduced by selecting the "Save" menu option with no document open." Or "After clicking on the "Calculate" button in the "Math" dialog box, the button flickers but nothing else happens, regardless of the equations entered into the editable field."

Whenever you notice an inconsistency in the operation of the program, note the complete circumstances surrounding the event, and the exact details of the problem. Check whether the problem can be reproduced or is intermittant, and explain exactly how the problem can be reproduced, or if intermittant, attempt to determine under what situations the problem occurs. If you're using MiNT, note all the crash info shown after a crash, since that helps the programmer to track problem the problem down.

Also, in the case of inconsistencies in the operation of the software, try making changes to see whether the problem can be avoided. For example if a program crashes while you're using it under the Geneva AES, try using the program under the Atari AES and see whether the problem goes away.

Well, in any case I think programmers are pleased to receive the valuable assistance of the beta testers, even if none of them are what could be called "a perfect beta tester." So above all, don't get too bogged down in the details, and just get on with trying the software out. That's the most important thing.

2152. help on pseudocode!!!Need by aug.23!!!

Newsgroup: comp.sys.atari.programmer
Date: 1998-08-23 00:00:00 UTC
From: Design2000 <AE@design2000.8m.com>
Message-ID: <01bdce63$2d694600$2c4418d2@suker>
Source record: 3867
Cross-posted to: alt.comp.shareware.programmer,comp.sys.acorn.programmer,comp.sys.amiga.programmer,comp.sys.apple2.programmer,comp.sys.atari.programmer,comp.sys.be.programmer,comp.sys.mac.programmer.codewarrior,comp.sys.mac.programmer.games,comp.sys.mac.programmer

Hi all! Please help me.i have to wrirte a pseudocode but dunno how to.
pls help me.i will give u the qn.

problem:

Jackpot is a popular game in Genting.We want to simulate the jackpot
machine on the computer by writing a computer program in pseudocode.The
program must simulate the jackpot machine by:

1) Using numbers instead of pics.(no.s range from 0-9.)
2) maintaining a certain amount of money(20 cent denominations) at the
start.Assume $200.
3) Allowing the player to simulate the insertion of 20 cent coins b4 the
lever can be pulled.
4) Allowing the player to simulate the pulling of the lever.
5) Simulating the dispensing of coins when theplayer wins.
6) maintaining the amount of coins on the machine.

PART 1:
Write the decision making statements that determine if a player wins.The
following are illustrated examples of the rules.

0 0 0 jackpot! (wins all in machine)

2 2 2 all values are same.(wins 50% of amt in
machine.)

1 2 3 any consecutive upward sequence.(10% of

amt in machine.)

6 5 4 Any consecutive downward sequence(wins
10% of amt in machine.)

2 4 6 Even no. upward or downward sequence
(wins 15% of the amt left in the machine)

1 3 5 odd no. upward or downward sequence (
wins 15% of the amt left in
the machine)

complete the following:

a)Hierachy chart
b)pesudocode.

*hint:: in pseudocode, use the following statement to mean the generation of a random no. between 0 t0 9 that represents one of the three no.s required for the jackpot machine.

number = generate (0-9)

In pseudocode, you outline how you're going to write the program,
but you describe the steps (pseudo-code), rather than actually
write the program.

So, for example, pseudo-code for describing how a program would
connect to a mail server to send a message would be something
like:

```
Connect to server
if connection_error then goto handle_error
send server "HELO" command
if connection_error then goto handle_error
...

handle_error:
display error dialog
goto exit
```

See what I mean? Just describe the steps, but don't write the
code.

2157. Help wanted: interrupts

Newsgroup: comp.sys.atari.programmer
Date: 1998-08-23 00:00:00 UTC
From: John.Kormylo@7861.conchbbs.com
Message-ID: <395_9808241348@conchbbs.com>
Source record: 3872

The interrupt handler for Xbtimer has to be written (at least
partially) in assembler, since it must preserve ALL the registers
(Pure C preserves A2-A7 & D3-D7) and must terminate with an RTE
instruction (not implemented in C).

```
SUPER ;required for RTE
XREF foo ;C function
XDEF vector ;interupt handler (shell)

vector:
movem.l A0-A1/D0-D2,-(A7) ;save registers
jsr foo ;Pure C function
movem.l (A7)+,A0-A1/D0-D2 ;restore registers
rte
```

Also, remember to define the variables which can be changed by the
interupt to be volatile.

Hi everybody,
here a list of my atari productions :

Programs

#1
Author: Dominique Bï¿½rï¿½ziat
Title: Notes
Target: All TOS compatible system
Type: Little utilitie to create notices
on your desktop. An AV-desktop is
highly recommanded.
Language: Fr/Eng
WIP: vers 2.11
WEB: http://www-air.inria.fr/~bereziat/windom.html

#2
Author: Dominique Bï¿½rï¿½ziat
Title: Magic Setup
Target: All TOS compatible system
Type: A graphical shell to setup easily
your MagiC file configuration (compatible MagiC6).
Language: Fr/Eng
WIP: vers 1.31
WEB: http://www-air.inria.fr/~bereziat/windom.html

#3
Author: Dominique Bï¿½rï¿½ziat
Title: Awele
Target: All TOS compatible system
Type: An african game with GEM interface
Language: Fr/Eng
WIP: vers 1.01
WEB: http://www-air.inria.fr/~bereziat/windom.html

#4
Author: Dominique Bï¿½rï¿½ziat
Title: SGscan
Target: All TOS compatible system
Type: A ttp utilities t create a ST-Guide image of
your drive (or folder).
Language: Fr/Eng
WIP: vers 1.1a
WEB: http://www-air.inria.fr/~bereziat/windom.html

#5
Author: Dominique Bï¿½rï¿½ziat
Title: Group
Target: All TOS compatible system
Type: A small utilitie to manage group objects as
Thing with a AV-desktop (including MagXdesk)
Type: All TOS compatible system
Language: Fr
WIP: vers 1.00
WEB: http://www-air.inria.fr/~bereziat/windom.html

#6
Author: Dominique Bï¿½rï¿½ziat
Title: Excellent!
Target: All multitasking TOS compatible system (*)
Type: An universal text viewer with an emacs-like
interface, plug-in modules, programmable
interface.
Language: Eng
WIP: vers 1.2R2
WEB: http://www-air.inria.fr/~bereziat/windom.html

(*): MagiC, MagicMac, Naes, MultiTOS, Geneva
problem with plain TOS due to dynamical libs

Developpement tools

#7
Author: Dominique Bï¿½rï¿½ziat
Title: WinDom
Target: All TOS compatible
Type: A GEM/TOS Pure C library.
Previous software are created with this
library. Sources and complete documentation
with tutorial avalaible.
Language: Fr
WIP: version 1 (May 98)
WEB: http://www-air.inria.fr/~bereziat/windom.html

#8
Author: Dominique Bï¿½rï¿½ziat
Title: WinVdi
Target: All TOS compatible
Type: A Vdi Pure C library to perform vdi call
into windows. Use WinDom environment.
Language: Fr
WIP: version 1 (Feb 98)
WEB: http://www-air.inria.fr/~bereziat/windom.html

#9
Author: Dominique Bï¿½rï¿½ziat
Title: WinEdit
Target: All TOS compatible

Type: A bad texte editable library using WinDom
environment.
Language: Fr
WIP: beta (Feb 98)
WEB: http://www-air.inria.fr/~bereziat/windom.html

#10
Author: Dominique Bï¿½rï¿½ziat
Title: WinRSC
Target: All TOS compatible
Type: A graphical GEM program builder,
code generated uses WinDom environment.
Language: Fr
WIP: beta (Oct 98), still in developpement,
a demo version is avalailable in following
URL:
WEB: http://www-air.inria.fr/~bereziat/windom.html

#11
Author: Dominique Bï¿½rï¿½ziat
Title: WinConf
Target: All TOS compatible
Type: To configure WinDom programsllok and feel.
Language: Fr
WIP: vers 1.5
WEB: http://www-air.inria.fr/~bereziat/windom.html

#12
Author: Dominique Bï¿½rï¿½ziat and Olivier Landemarre
Title: Librairies Dynamiques Gem (Gem Dynamical Libraries)
Target: All TOS compatible
Type: A Gnuc/PureC library to manage dynamicals libraries.
Language: Fr
WIP: vers 0.81 (beta version)
Drawback: bag bugs under plainTOS
WEB: http://www-air.inria.fr/~bereziat/windom.html

That's all folk

2159. NOS.046 is OUT ! Take it !

Newsgroup: comp.sys.atari.programmer
Date: 1998-08-24 00:00:00 UTC
From: mike@bbsgate.interware.R.E.M.O.V.E.T.O.R.E.P.L.Y.it
Message-ID: <4848_mike@bbsgate.interware.R.E.M.O.V.E.T.O.R.E.P.L.Y.it>
Source record: 3874

Finally NOS.046 is ready ! I am going to put it on:

ftp.interware.it/users/mike/pub
or go to:
www.interware.it/users/mike
and look for the "public download directory" at the beginning of the page.

You can also request the file at my BBS, +39-40-768412 fidonet+nest
2:333/608@fidonet.org
90:700/104@nest.ftn

I can also send you the files by email, tell me what version you need.

nos046.lzh is the 68000 binary+readme
nos04630.lzh is the 68030 binary+readme
nos046_s.lzh is the sources archive

- I added the ability for nntpcli to try GROUP and STAT commands after a failure occurs with the NEWNEWS command, provided that NN_USESTAT was #define'd at compile time. It seems that NEWNEWS is disabled by some Internet Service Providers (ISPs), who think it adds overhead to their NNTP server, and who reason that NEWNEWS is not needed by a news client. Nos can now use typical news client commands to recover from a newnews error, BUT the news groups must be explicitly named, that is, the names must not contain a '*' or '!'. The article numbers for each host and newsgroup are stored in a new file, named "<area>.rc", kept in the same directory as the associated . I modified nntp_job() in nntpcli.c and added statnew().

- I finally included the pop3 mail client, it works as in standard nos doc, try "help popmail" to know more or read here, note that 'pop' command and 'pop2' protocol are not implemented in Atari NOS (do you need them?):

=======
popmail
=======

[N.B. This is different from the 'pop' command].

The Post Office Protocols (POP2 and POP3), are mail protocols designed for use in networks containing hosts that are normally turned off when they are not in use. In this environment it is not possible for an SMTP mail server to deliver mail to these hosts because they are not always available.

The solution to this problem is to designate a mailbox server that is available to the network at all times and can accept SMTP mail for other hosts. When a host comes on-line it uses POP to

access the mail in its mailbox(es) on the mailbox server.

The advantage of using a POP server at an area mail gateway is that when mail arrives at the gateway for a station that may not be available, the gateway does not have to waste time trying to establish a connection with that station. Instead it accepts the mail and places it in the addressee's mailbox, just as if the addressee were a normal user on the gateway system (that is, this is the same thing that is done with AX.25 BBSs).

As POP2 and POP3 are different and incompatible protocols, both the POP2 and POP3 servers should be started, to handle all POP requests from clients.

The POP server requires one data file called /popusers.

The POP protocols are very simple, with minimal error handling. When an error is encountered, an error message is generated and then the connection is terminated. You then have to re-establish a connection to continue.

---

popmail addserver <host> [<seconds>] [<hh:mm-hh:mm>] <protocol> <mailbox> <username> <password>

Add <host> as a pop server. When <seconds> is given, a timer is started to query the host with that interval for mail.

If not specified no quering to the pop host will be started. You have to do that manually with a 'kick'.

When <hh:mm-hh:mm> is given then only in that exact timeframe are queries to the host made (allowed).

Protocol is either POP2 or POP3, depending on the mail service the host is providing. Note: pop2 is superceded by pop3.

<mailbox> is the mailbox name on the host from which mail has to be picked up.

<username> and <password> are this system's validation parameters for the host (in /popusers).

Note that on entering this command the host name is looked up. If non existent an error message is presented.

>> Example: (all on one line):

popmail addserver ns9bob 1800 00:00-03:00 pop3 ns9liz ns9liz lizpasswd

---

popmail dropserver <host>

Drop host from the list of pop servers to be queried. All

references to the entry are deleted from the current system.

>> Example: popmail dropserver ns9bob

---
popmail kick

Kick the local POP client, to get mail from the server. This
command is needed when no interval is specified with the 'popmail
addserver' command.

---
popmail list

List the current popmail server table.

---
popmail quiet [on|off] Default: off

Display or set the POP quiet flag.

This flag determines whether the bell sounds when the system
announces that incoming mail has arrived. When quiet is set to
'off' you hear the bell.

>> Example: pop quiet on

---
popmail trace [<level>]

Display or set the trace level of POP sessions.

<level> = 0: no trace
1: serious errors reported
2: transient errors reported
3: session progress reported

All trace output goes to the session log file.

* ---
* # Example of setup for the POP3 mail client
* popmail addserver 151.99.226.3 POP3 mike mike mikepw
* #popmail quiet on
* fkey 62 "pop kick 151.99.226.3\n"
* ---

- Enhanced Help function. Now you can use '?' as before to list available
commands and help <command> <subcommand> as long as you put *.HLP files
in the help directory, same sintax as ftp.hlp, I am giving some starting
help files with 0.46, how do want to complete the job ?

- I also modified few things like the fkey command, to catch the correct keys
from the Atari keyboard, please check how it works.

- Please send me your impressions and requests, maybe I will be able to go on with the project if enough people is interested.

Join the NOS mailing list sending an email to net2net@bbsgate.interware.it with subject: "SUBSCRIBE NOS".

Hi!

Can anyone give me an introduction in programming interrupts in (Pure) C on my Atari ST? I want to program a sequencer, so the main program should be interrupted to increase the pulse-per-quarter-counter in certain intervals depending on the bpms. Please try to explain easily for I had a break in programming for a few years.

Please mail and not post!

if (!Fsfirst(argv[1], FA_SUBDIR))
do{
if (d.d_attrib!=FA_SUBDIR)
{
r++;
}
}while(!Fsnext());

return r;
}
```

This simple program returns the number of files matching the wildcard passed
as argument (parameter) in the current directory, I just need to adapt it
for the VFAT environment.

Could you please suggest how to make it work with MagiC ? I tryed:

```
#include <mintbind.h>
#include <tos.h>
#include "magx.h"
#include "mgx_xfs.h"

void main()
{
// Pdomain( PDOM_TOS /* 0 */ );
Pdomain( PDOM_MINT /* 1 */ );
{
XATTR xattr;
LONG dirhandle;
LONG err,xr;

dirhandle = Dopendir(".", DOPEN_NORMAL /* 0 */ );
if (dirhandle >= 0)
{
BYTE buf[128]="pippo";
do {
```

```
err = Dreaddir(128, dirhandle, buf);
// err = Dxreaddir(sizeof(buf), dirhandle, buf,
// &xattr, &xr);
printf("%s\n",buf);
// if (xr)
// printf(".. Fehler bei Fxattr ..\n");
if (err)
printf(".. Fehler bei Dreaddir ..\n");
}
while(!err);
Dclosedir(dirhandle);
}
}
}
```

But does not work, a strange string is printed for each file and Dxreaddir is not available in my binding.

Can anybody help me to know what is the rigth binding for Dxreaddir ?
Is there any MagX library I can use with Lattice C ?

Oh nonsense! The doofus spammed every programming newsgroup this side of McMurdo Sound with an obvious solicitation for us to do his homework for him. I don't care whether he loses his computer account; I think he should be slapped around a little.

I think you took that a bit far. Normally x-posters are new to the web and have not yet learnt web etiquette. When I first came to the web I know that I did a bit of x-posting myself. I think the author was obviously trying to post a relevant question. Maybe it would have been better to direct him to a place where his question would be more relevant, or recommend web sites that are on pseudo code. I would do the same but I know nothing about pseudo code. It would have at least been better to write to the author and tell him that you think the post was inappropriate. If the problem persisted then perhaps you could talk to his post master.

I am sorry, but I do not agree with you. The original question may well have been a mistake, and it might even have been someone's homework.

It is okay for those of you who live in cloud-perfect-land to criticise the actions of others, but just because you know what "netiquette" is does not mean, and cannot mean, that everyone else is so aware. Cripes, we all make mistakes don't we?

If you do not like something, it is simple to ignore it and move on to the next message. Since when were you voted in to be everyone's spokesperson on these newsgroups anyway?

Very likely, given the style in which it was posted. Especially
telling is how the problem statement was well edited, and the
surrounding text a mishmash. This is a sign of copy and paste, to
me.

>It is okay for those of you who live in cloud-perfect-land to
>criticise the actions of others, but just because you know what
>"netiquette" is does not mean, and cannot mean, that everyone else is
>so aware. Cripes, we all make mistakes don't we?

Yep, and when we do, the downside varies according to the magnitude
of the error. Had he merely posted his homework question to a single
programmer group, he would not have been nailed for spam. He might
still face administrative penalties at his home university, but it is
not likely that posting a single message will get you nailed as a
spammer.

He made a big error - posting to virtually every programming group
out there. Had he been let off with a warning that did not
inconvenience him, he would have felt no real need to avoid it in
the future. Nor would the people reading the group who saw the
technique and the results.

Now, a large group of people watching may be a little less quick to
post. That has negatives, but it does mean that the group stays
civilized for a bit longer. After watching sci.physics.relativity
fall from a useful group in which begineers and experts could
share ideas to a ceaseless pit of noise, I am not eager to see the
programmer groups vanish under the load of the freshman class.

Back when I started with news, I made errors too. I did not,
though, cross the major lines. At that point, the big bugaboo was

posting commercial ads in inappropriate groups. I was careful
partially because I knew of people at my own college who had lost
net access because of it. I knew that there were penalties, so I
read the rules of usage. Amazingly enough, I even read newsgroups
before posting, simply because posting boneheaded posts such
that the administrators got complaints could lose you access, and
they made sure we knew it.

It is now so easy to get access that losing an account is virtually
irrelevant. Get a modem, hook up to dejanews, and you are
back in business.

>If you do not like something, it is simple to ignore it and move on to
>the next message. Since when were you voted in to be everyone's
>spokesperson on these newsgroups anyway?

If we do not enforce at least minimal rules, then this becomes
complete anarchy. Again, before assuming that I am asking for
a net cop, go look at sci.physics.relativity. Look for the content,
and look for the kooks. Scary, and it can happen in any newsgroup
if the group does not police itself.

comp.sys.mac.programmer.codewarrior has been better than most
in that regard. There are groups (comp.lang.java.programmer springs
to mind) where moderation better happen soon, else the group is going
to be virtually devoid of content. Spammers do hurt, in that they
dilute content.

use:
~WIND_SET(win_handle%,24,1,0,0,0) with GFA
or
wind_get(handle,WF_BEVENT,1) with C

Be carefull with editables objets and the redraws after this
function. To go back to old window managment, use 0 instead of 1.

Cheers.

use this after opening of a window

#define WF_BEVENT 24
wind_set(handle,WF_BEVENT,0x0001,0,0,0);

After this the window is not topped when you click in a object
on a window which isn't on top .
This only works on AES versions supporting this (4.0 or better)

It was his postmaster that decided to kick him off not me. I merely
complained about the spamming and will do the same if others post
innappropriate messages repeatedly. The fact that the guy x-posted to
a dozen groups is not offensive in itself but served to compound the
problem in this case. Just think what Usenet would be like if every
newbie behaved like this guy, how would you feel about writing to
dozens of jerks per day telling them that their posts were
innappropriate? I think it is the responsibility of the author to obey
netiquette, 99% of people can figure it out so why shouldn't the
spammers? Incidentally, did you take the time to write to this guy? If
you did not then I think you have a bit of a cheek telling me I took
things too far, at least I took the time to make sure this guy doesn't
spam again.

2178. Re: Dxreaddir, lattice, MagX

Newsgroup: comp.sys.atari.programmer

Source record: 3892

Found the problem (after long testing), you have to skip the first 4 bytes of
the string returned by Dreaddir or Dxreaddir, I think this is what the
following means:
---
fnamebuf enth&#65533;lt dabei in den ersten 4 Bytes die Inode-Nummer, die man
normalerweise nicht braucht (Fehldesign von Dxreaddir) und die in der
XATTR-Struktur sowieso nochmal drinsteht.

But please tell me want is the meaning of this:

Nach Dateitypmustern wie "*.prg" kann dabei nicht gesucht werden,
stattessen mu&#65533; man selbst auf regul&#65533;re Ausdr&#65533;cke abtesten.

```
Btw I post here the example program I have done and that works with Lattice,
after correcting mintbind.h and osbind.h (this was also tricky) !!

#include <mintbind.h>
#include <tos.h>
#include "magx.h"
#include "mgx_xfs.h"

void main()
{
// Pdomain( PDOM_TOS /* 0 */ );
Pdomain( PDOM_MINT /* 1 */ );
{
XATTR xattr;
long dirhandle;
LONG err,xr;

dirhandle = Dopendir(".", DOPEN_NORMAL /* 0 */ );
if (dirhandle >= 0)
{
char buf[128];
do {
// err = Dreaddir(128, dirhandle, buf); <-- you can also try this
err = Dxreaddir(128, dirhandle, buf, &xattr, &xr);
if (xr)
printf(".. Fehler bei Fxattr: %d ..\n",xr);
if (err)
{
if(err!=-49) /* if not end of reading */ //<-- found this by test
printf(".. Fehler bei Dreaddir: %ld ..\n",err);
}
```

```
else
{
printf("%s,%u\n",&buf[4],xattr.attr);
//In the following comment lines is how I found the problem
// printf("***%c%c%c%c***\n",buf[0],buf[1],buf[2],buf[3]);
// printf("%u,%u,%u,%u,%u,%u,%u,%u,%u,%u\n",
// buf[0],buf[1],buf[2],buf[3],buf[4],
// buf[5],buf[6],buf[7],buf[8],buf[9]);
// printf("%lu %lu %lu\n",buf,xattr,xr);
if ((xattr.mode & S_IFMT) == S_IFLNK)
{
XATTR xa2;

// printf("SymLink found %s,%u\n",&buf[4],xattr.attr);
err = Fxattr(0, &buf[4], &xa2);
if (!err)
xattr = xa2;
printf("SymLink dereferenced %s,%u\n",&buf[4],xattr.attr);
err = 0;
}
}
}while(!err);
Dclosedir(dirhandle);
}
}
}
```

wind_set(handle,WF_BEVENT,1,0,0,0);

where WF_BFEVENT = 24

This only works under AES 4.x and equivilent, or where indicated by
appl_getinfo() (mode 11, where bit 5 of ap_gout1 is set).

Hi!

centek <centek@graphity.fr> wrote:
> Unfortunately, the Thing documetation only says how to install the
> font-selector,

Well, the German docs /do/ have docs on the font protocol itself, and I actually doubt Joe Connor left them out when translating the hypertext.

But as it's a bit difficult to find them directly, here's how to get there:

From the main screen, go to 'Protocols', then to 'Font protocol' (the names in the translation may differ). From here, use the Forward- and Backward-Buttons of ST-Guide to navigate to the description of the messages used for the Font protocol.

As you might see now, I didn't make a mistake, the docs are there.

Ciao

Thomas

P.S.: ST-Guide has a "Search" function ...

Found the problem (after long testing), you have to skip the first 4 bytes of
the string returned by Dreaddir or Dxreaddir, I think this is what the
following means:
---
fnamebuf enth&#65533;lt dabei in den ersten 4 Bytes die Inode-Nummer, die man
normalerweise nicht braucht (Fehldesign von Dxreaddir) und die in der
XATTR-Struktur sowieso nochmal drinsteht.

But please tell me want is the meaning of this:

Nach Dateitypmustern wie "*.prg" kann dabei nicht gesucht werden,
stattessen mu&#65533; man selbst auf regul&#65533;re Ausdr&#65533;cke abtesten.

```
Btw I post here the example program I have done and that works with Lattice,
after correcting mintbind.h and osbind.h (this was also tricky) !!

#include <mintbind.h>
#include <tos.h>
#include "magx.h"
#include "mgx_xfs.h"

void main()
{
// Pdomain( PDOM_TOS /* 0 */ );
Pdomain( PDOM_MINT /* 1 */ );
{
XATTR xattr;
long dirhandle;
LONG err,xr;

dirhandle = Dopendir(".", DOPEN_NORMAL /* 0 */ );
if (dirhandle >= 0)
{
char buf[128];
do {
// err = Dreaddir(128, dirhandle, buf); <-- you can also try this
err = Dxreaddir(128, dirhandle, buf, &xattr, &xr);
if (xr)
printf(".. Fehler bei Fxattr: %d ..\n",xr);
if (err)
{
if(err!=-49) /* if not end of reading */ //<-- found this by test
printf(".. Fehler bei Dreaddir: %ld ..\n",err);
}
```

```
else
{
printf("%s,%u\n",&buf[4],xattr.attr);
//In the following comment lines is how I found the problem
// printf("***%c%c%c%c***\n",buf[0],buf[1],buf[2],buf[3]);
// printf("%u,%u,%u,%u,%u,%u,%u,%u,%u,%u\n",
// buf[0],buf[1],buf[2],buf[3],buf[4],
// buf[5],buf[6],buf[7],buf[8],buf[9]);
// printf("%lu %lu %lu\n",buf,xattr,xr);
if ((xattr.mode & S_IFMT) == S_IFLNK)
{
XATTR xa2;

// printf("SymLink found %s,%u\n",&buf[4],xattr.attr);
err = Fxattr(0, &buf[4], &xa2);
if (!err)
xattr = xa2;
printf("SymLink dereferenced %s,%u\n",&buf[4],xattr.attr);
err = 0;
}
}
}while(!err);
Dclosedir(dirhandle);
}
}
}
```

Okay, I think we've beaten this topic around enough. It's good to meet our neighbors, though (Hi Apple II programmers! ^_^) but I think we can lay this one to rest.

One last thing though... Isn't it kinda interesting that the Windows programming groups were strangely left out? Kinda makes you wonder. Maybe the kid wasn't a lost hope after all? ^_-

I am in the finishing stages of my DLL engine for the Atari. (I wanted to have it ready for release late July through early August, but was unable to)

As this is my first programmer-oriented app (previously all my apps were user-oriented), I would like to find out what feature set you would want in a DLL manager.

The manager runs from the AUTO folder, initialises itself, and then scans a folder for libraries.

When it finds one, it will examine it to see if it should be boot loaded. If the "boot me" flag is set, it will load the library, otherwise it is left alone.

Once all the library files in this folder have been searched, the manager will go TSR.

Later, when an application wishes to use a library (or find out if it is already loaded), it can query the manager as to whether the library is available.

If not, it may load a library dynamically and make calls to it.

All calls are via a redirected TRAP vector (although for you speed freaks out there, you can also call a library via a jumptable). Libraries are given a handle number when they are loaded, which is used when making calls to the library, and when unloading the library.

The managers API has the following functions: LibAvailable to find if a library is loaded, LibLoad/LibFree to load or unload a library, LibFirst/LibNext to enumerate all loaded libraries, LibTest to test a library file on disc, LibCount to count how many libraries are loaded, LibFlagsSet to alter a librarys flags (to make it bootable or not, for example) and LibFileInfo to get the library info block from the library file so that an app can interrogate a library file more closely.

Is there anything obvious library-wise I have left out?

It also has other non-library functionality - such as enumerating the cookie jar, or getting/changing a specific cookie, querying the computers hardware, and so forth.

Yep I'd be interested even though I've never used C. I'm sure with a bit reading I could eventually figure it out though. Do any of these routines come with decent commented code? Also anything there on disk layouts?

Scott.

I should of posted this in my last responce but...

Does anyone know where to obtain a decent up to date text/document/web page explaining disk layouts. Such as directory sectors, fat sectors, boot sectors e.t.c. Most of the documents I have located seem to be older and the disk formats have changed. Some people here have a great deal of knowledge on this topic and could perhaps post a little article on it if they have the time. This type of information is useful for everyone, not only programmers.

Thanks

Scott.

>is established

There's an option in the modem list with NTWS4 named something like
"serial cable between 2 PC's". I installed that and fiddled with RAS
to make it a dial-in connection. Using STiK, I got NT as far as
realising STiK was sending something whereupon NT "picked up" the
line.

Unfortunately, I can't get any further than this due to a PC hardware
failure - but it was looking good until then.

The next step would have been to use STiNG for the PPP and get the
rest of the NT settings right.

>you as a programmer are looking for?

Personally ...

It's difficult to say as I've no idea what the betatester knows
initially. Some may program, some may not, and each produce different
reports equally valid in their own context.

The thing that makes me the happiest is to see the program behaving
the same in all environments. Even if it's a bug I'd prefer to see all
machines fall foul of it than just a few - because you can bet "that
few" are machines you do not have direct access to. Therefore these
problems can be incredibly hard to fix.

>I have a registered Profile2.2, are there other system programs that
>would give you important feedback?
>is there a Standard Operating Procedure that a beta tester can use?

Just one. Try and break the program, preferably in such a way that
your description will allow others to break it. ;-)

>or is there a prg that would run in the background keeping track of
>system calls etc and writing the info to a text file upon a crash! :-)

The program being tested should write its own debug information.

Firstly, it gives the programmer a much better idea of where the buggy
code lies.

Secondly, even the programmer may not have any idea what system calls
are invoked by his use of a particular call.

The are bugs in compiler library code and bugs in the operating
system. If the programmer cannot not be sure exactly which bit of his
code is producing the problem then he'll never be able to say his code
is really okay - that something else has caused it to fail by forcing
that bit of code to deal with data is should not have to.

>So far I have been just writing down what happens when a prg does a
>crash or something unexpected; along with a Profile2.2 report.

Yes. Other's have answered it.

>I want to
>say, clic on button, object...on a window which isn't on top ?

When background mode is active the window will behave as though it
were on top as far as programming for it is concerned. On systems
which don't support the feature the window will be topped first, and
you'll have to click again just like normal. On systems where the
background mode is active then you need to click on the menubar to get
it topped.

Aside from the obvious use, using this mode is a darn good way of
testing your redraw code works properly! :-))

As I understand it ...

The first 4 bytes are an index value, followed by the filename. This
index value is present in order to support systems where two or more
distinct files of the same name may exist - it allows you to
distinguish between them.

In compatibility (ie 8+3) mode the filename starts at the beginning
like you'd expect.

It simply means you cannot use wildcards or regular expressions
directly with Dreaddir. You mus read all the items in the dir and then
test the names against wildcards/regexp. yourself.

> distinguish between them.

No, it's the other way 'round. On filesystems like MinixFS, files may be hardlinked, i.e. two (or more) directory entries refer to the same file on disk. This is achieved by inodes, each of which conatains all information about the file/dir, like timestamps, length, type, access permissions and which blocks on disk belong to the file. A directory entry on such a filesystem thus does only contain the filename and a reference to the inode. The inode itself has a unique number and a usage count, which is > 1 if more than one directory entry is linked to it.

This inode number is what's returned by D(x)readdir() (also to be found in the index-field of the XATTR structure) and allows to detect whether two different directory entries refer to the same file.

Also note that deleting a file on an inode-base filesystem actually means removing the directory entry decreasing the link count of the inode. Only if it gets zero, the inode itself and the file blocks will be deleted. That's why under UNIX, the system call to remove a file is called 'unlink()'.

Another nifty thing some (or most) inode base filesystems allow you: Opening a file for reading or writing also increases the link count of the inode. Thus, you can safely remove the directory entry after opening the file. The used blocks get automatically freed as soon as the file is closed, as the link count of the inode gets zero, then.

> In compatibility (ie 8+3) mode the filename starts at the beginning
> like you'd expect.

Well, compatibility mode is more a less a "no-no" ;) It does not have any significant advantage over Fsfirst()/next().

Ciao

Thomas

Hi !
I would like to use the Drag'n Drop protocol. The only documentation I have, is the good old lame Compendium, and it is not clear at all. It says that my APP should recieve a header wich indicates the data lenght. But at the same time, it gives a file name plus an other string (wich I dont understand the meaning).
Would it be possible that one of you gives me a small source code ?
Thanks.

Thomas

>come with decent commented code?

Yes. The routines actually form part of one of my object libraries
which is good news in this respect. I document these at two levels: in
the code like everybody else; and also in special comment markers /*[
and]*/ which can be extracted by a small utility and appended to a
helpfile - 'cos you can guarantee I'll have forgotten how to use it by
the next day! :-)

As an example, here's one of the modules ...

```
#include <cpu.h>
#include <mem.h>
#include "msdos.h"

MSBOOT*
_ms_stb2msb(m,s)
MSBOOT *m;
STBOOT *s;
/*[ MSBOOT* _ms_stb2msb(m,s)
MSBOOT *m;
STBOOT *s;
```

```
_ms_stb2msb() converts a Motorola boot sector to Microsoft format
and returns 'm' to the caller. 's' is the Motorola block,
'm' the Microsoft block.

Note that if s->stb_boot is not NULL then 482 bytes of boot code
is copied from s->stb_boot to m->msb_boot. A NULL value ensures
this does not happen. Note that no format conversion is done on
the boot code.
]*/
{
/* copy 'bra,oem' as is */
qmemcpy(&m->msb_bra[0],&s->stb_bra,8);

/* 24 bit serial no. */
cp_wrol(&m->msb_serial[0],cp_86long(s->stb_serial));

/* bytes per sector */
cp_wrow(&m->msb_bps[0],cp_86word(s->stb_bps));

/* sectors per cluster */
m->msb_spc[0] = s->stb_spc;

/* reserved sectors unused by TOS */
cp_wrow(&m->msb_res[0],cp_86word(s->stb_res));

/* number of FAT tables */
m->msb_nfats[0] = s->stb_nfats;

/* number of possible directory entries */
cp_wrow(&m->msb_ndirs[0],cp_86word(s->stb_ndirs));

/* number of sectors on media */
cp_wrow(&m->msb_nsects[0],cp_86word(s->stb_nsects));

/* media descriptor, unused by TOS */
m->msb_media[0] = s->stb_media;

/* sectors in a FAT table */
cp_wrow(&m->msb_spf[0],cp_86word(s->stb_spf));

/* sectors in a track */
cp_wrow(&m->msb_spt[0],cp_86word(s->stb_spt));

/* number of sides on media */
cp_wrow(&m->msb_nsides[0],cp_86word(s->stb_nsides));

/* number of hideen sectors, ?unused by TOS? (zero) */
cp_wrow(&m->msb_nhid[0],cp_86word(s->stb_nhid));

/* ?copy boot code? */
if (s->stb_boot != NULL) qmemcpy(m->msb_boot,s->stb_boot,482);

return m;
}

>Also anything there on disk layouts?
```

Not in english but in code, yes. There is stuff to manipulate the
bootsector, FAT(s) (12 or 16 bit), and root directory. It's easier if
I just post the header file msdos.h. That way you can see for yourself
exactly what functions and macros are in it ...

```

I found the compendium to be very clear on this. It actually gives a
step-by-step guide on how to do it. I managed to get a routine going 1st
try after reading this. Sure you read the appendix, about the Drag&Drop?

Anyway, if you haven't been able to get some help, send me a private
mail, and I'll let you have my Drag&Drop routine.. it's all ASM..

Yup but be aware that if you put dialogs in the window there will be
problems with edit fields and buttons as they do not clip. If you
have made a library for windowd dialogs it's not a major problem
as you can replace the offending routine (I can't remember the name
right now).

Hi!

JACCARD Emmanuel <softjee@wanadoo.fr> wrote:
> It is possible to access to a window which is not topped ? I want to
> say, clic on button, object...on a window which isn't on top ?

Another way (besides the already mentioned WF_BEVENT) is to interpret
the "WM_TOPPED" message differently, i.e. do not directly top the
affected window, but check whether the mouse pointer is currently over
an object of interest and handle it like the object was clicked.

Of course, this is a bit of an abuse of GEM messages, but it works with
all AESes.

Also note (using either method) that clicking on a free area of the
window should always be interpret as "top this window", because
otherwise it's very annoying if you can't top the window anymore (except
the border elements when using WF_BEVENT).

Ciao

Thomas

Yes, multitasking OSes like Magic provide the user access to scroll
bars, arrows, etc. to windows that are not the top window. Your
should always make certain you set the clipping rectangle (vs_clip())
according to the rectangle you get when 'walking' the rectangle list
in GEM.

Single tasking OSes usually do not allow access to any bu the top
window.

No special things to do programming wise. If you don't perform
clipping correctly, there will be some strange side effects when, say,
clicking the scroll bar, and the window underneath overwrites the top
window without becoming the top window, etc.

Hi everybody !

I thank you for your answer about "windows".

Now i have a new problem....If you can help me !

I want ot use XBIOS call in a interrupt but its seems there're somes
problems.
The interrupt is the TIMER A, i mask all the other and i call my XBIOS
function. This call don't run, the stack seems to have a problem after
this calling....

So i can't use XBIOS call in interrupt ?

Thanks to all !

Under what AES does this happen? Surely not under N.AES, and I'll be
very surprised if MagiC or Geneva does this as well.

I have found this with all AESes. I must admit that it was a LONG time since I looked at it and fixed it so I don't exactly remember what needed changing (I think it's form_button which need attention), but I'm sure all AESs had the problem and still has it.

This does ofcourse only happen when the window you are using is in the background and is partly covered by another window. How could the AES know "where" the object tree is to be drawn anyway? It does not have any clue if it's coverd by another window or not and it's up to the user to clip it. If you then use form_button (or whatever it's called...), which is the normal way of handling button clicks inside a window when a dialog is used, the AES will just draw the selected button without any clipping. For edit fields you will see that the "marker" will draw right over the window in front as well.

Yes, exactly you can't !
That is because most, if not all, of the ROM routines
are written in a non reentrant manner, that is, you can't call a function
from XBIOS (e.g.) from an Interrupt, while any other XBIOS routine is
running, that corrupts part of the information the "noninterrupt" call
is relying on. That may cause a crash, but does not have to crash, as in
your case, where just your stack gets corrupted.

: Thanks to all !

Hi!

Konstantinos Xonis <gc85@vision.hrz.uni-giessen.de> wrote:
> Yes, exactly you can't !

According to the Profibuch (and personal experience) it is possible to use BIOS and XBIOS calls from within an interrupt handler, with some restrictions. The trick is to manually alter the pointer to the memory area where TOS' trap dispatcher saves registers and return address:

(Code sample taken from Profibuch):

```
savptr = $4a2
amount = 46

; Beginning of interrupt handler
interrupt_routine:
sub.l #amount,savptr.w

[Use BIOS- and XBIOS-calls]

; End of interrupt handler
add.l #amount,savptr.w
rte
```

The most important restriction: Only one interrupt handler may do this at the same time. Also, the storage savptr points to cannot handle more than three recursions (i.e. it only lasts for 3 * 46 bytes). Another problem that may arise is that TOS' trap dispatcher doesn't lock interrupts when saving/restoring registers, so an interrupt which uses the above trick possibly occurs exactly in that moment, which will also cause serious problems.

But so far I haven't experienced many problems in "real life". TOS2GEM uses this method (a bit different, because it uses its own savptr-area and a temporary supervisor stack) for the VBL-driven refrehs - which even call the VDI! So far no one has ever reported problems, but as it's still possible something goes wrong on some special system, the VBL-refrehsh can be disabled by an external program.

Ciao

Thomas

2214. STiNG-programming

Newsgroup: comp.sys.atari.programmer
Date: 1998-09-02 00:00:00 UTC
From: Gilda Henrik <di98gihe@ios.chalmers.se>
Message-ID: <35ED32E4.79C846F4@ios.chalmers.se>
Source record: 3829

Hi everybody!

I'm very interested in using STiNG in my game called Reeking Rubber (for the Falcon030), to give the ability of multiplayer mode. I code exclusively in assembly-language.
I've looked at some docs about coding sting, but it didn't give me the essential information I need, like:

1. Does STiNG need a VBL-interrupt to be able to run, or is it driven by some other interrupt? Now my game replaces the vbl-vector at $70, so no other vbl-interrupts are carried out. IOW my game does not use XBRA to link my vbl-routine inbetween the others, because the routine needs to be the first to be executed each VBL, to avoid flickering on the screen.

2. Is STiNG relying on AES events to run? I turn off AES in the game, so the OS won't do anything to my screens.

3. I've understood so far that it might be a good idea to let STiNG call a handler to take care of incoming IP-packets, and that I can patch in my own handler. It's just that the few examples available is in C. Where should the handler expect to find the pointer to the IP-packet?

4. How do I call the different functions of STiNG in assembler? I saw something about 'jsr to the required function', but where are the pointers to these functions? And input parameters to the functions, should they be put on the stack or in some data/address registers?

Thanks in advance
Henrik Gildï¿½ (Hencox/Nature)

Hi!

Konstantinos Xonis <gc85@vision.hrz.uni-giessen.de> wrote:
> OK, i have to admit, I did not knew that, but to have the last word ;)
> it is a work around !

But it's a workaround documented by Atari in "Hitchhiker's guide to the
BIOS" (IIRC). So it's an official way to do it.

Ciao

Thomas

The obvious question is why? ;-)

>Thanx for yours answers.

I've never had a need to do this but as no-one else has answered I'll
give it a bash. Even more amazingly I'll do with without the safety
net of having an Atari to try it on just now! <g>

There seem to be four system variables associated with this:

```
uint32 *memvalid =0x420;
uint16 *memctrl =0x424;
uint32 resvalid =0x426;
uint32 *resvector =0x42a;
```

and the reset address for the cpu is:

```
uint32 *resetpc =0x004;
```

'memctrl' is a copy of the value which got written into the memory
controller. I'll ignore it.

'memvalid' is a flag denoting if the controller's config is valid. It
must be - we're running, so I'll ignore that also.

'resvalid' denotes if the reset routine whose address is in
'resvector' is usable or not. I assume this is the warmstart code.
Also it makes sense that the next reset will be a warmstart unless we
force otherwise.

Finally, I have a vague recollection the value of PI is used to denote
that 'resvector' is valid. I also assume the contents of 'resvector'
has already been set to a warmstart routine by the system.

The code, based on the above assumptions ...

```
void
Reset(bool coldstart)
{uint32 pi =0x31415926L;
void (*fcp)() =*resetpc;
```

```
(void)Super(0L);
*resvalid = coldstart ? ~pi : pi;
(*fcp)();
}
```

>this calling....
>
>So i can't use XBIOS call in interrupt ?

Nope. It is re-entrant to 3 levels but not from interrupts. To stand
any chance of using it you'd have to be able to restore the xbios
context prior to making the xbios call *and* know exactly what that
call did internally.

I seem to recall (from years back) there being an "in-dos" flag in
MSDOS which msdos would set when it was being called. A TSR could sit
there polling the in-dos flag until it was clear, at which point it
could make a hurried dos call. I mention this because MagiC has an
entry of the same name. It *might* be possible it serves a similar
function. Mind you, if you're using MagiC then better solutions could
be found via multitasking.

Anyway, best to keep things simple. If possible, just have your
interrupt set a flag in memory. The flag in turn can be the trigger
for another piece of code (the main app, desktop accessory, or
parallel process under multitasking) to make the xbios call under
better circumstances.

MagiC, version 2 at least. That was the environment being used while I
was implementing this sort of background code. Frankly I'd expect the
same behaviour from all AES's.

For an AES to be able to automatically deal with background windows it
would either have to posess a 'multi-clipping' rectangle list or walk
the redraw rectangles. From a programmer's aspect such a feature would
be pointless as you'd still have to cater for AES's which did not have
the ability. It follows that there is little incentive for a designer
to add it either.

The root cause of the problem is objc_draw and objc_change. I can't
remember the details but little niggling inconsistencies with
objc_change resulted in me "emulating it" with objc_draw.

You're welcome. And I don't see an obvious reason why it shouldn't work
with the Hades or the Milan, too.

> Another question, why the number 46 ?

This area is used by the trap dispatcher to save registers d3-d7/a3-a7
(10 * 4 bytes), the status register (2 bytes), and the return address (4
bytes), making a total of 46 bytes.

Ciao

Thomas

It might work but I doubt it. STiK, the predecessor to STiNG
implemented a non blocking resolver and iirc this relies on the AES.

For an informed answer, hope Peter responds! He'll also be able to
answer (1).

>3. I've understood so far that it might be a good idea to let STiNG call
>a handler to take care of incoming IP-packets, and that I can patch in

I'm not at all sure what you mean here, but essentially, the Transport
Layer (below) has calls to do what you what.

>4. How do I call the different functions of STiNG in assembler? I saw
>something about 'jsr to the required function', but where are the
>pointers to these functions?

In the TPL structure which is declared in the transprt.h file. You'll
see a line ...

extern TPL *tpl;

... which is the base address through which all the functions are
located. The variable 'tpl' is a pointer to the datatype TPL. Take the
TCP_open call for instance. It's declared thus:

```
typedef struct tpl {
[snip lots of other declarations]

int16 (*TCP_open)(uint32, int16, int16, uint16);

[snip lots of other declarations]
} TPL;
```

Further down there's some macros which make it easier for C programmers to use them. The one for TCP_open is ...

```
#define TCP_open(h,p,t,o) (*tpl->TCP_open)(h,p,t,o)
```

So, when you see ...

```
TCP_open(arg1,arg2,arg3,arg4);
```

... in example C code then you should read it as ...

```
(*tpl->TCP_open)(arg1,arg2,arg3,arg4);
```

The TPL structure is quite large. It'll be easier to explain with a smaller example:

```
typedef struct fred {
uint16 (*x)(int16,char*);
void (*y)(int32);
int16 (*z)(void);
} FRED;

extern FRED *f;

#define CallX(a,b) (*f->x)(a,b)
#define CallY(d) (*f->y)(d)
#define CallZ() (*f->z)()
```

Lets imagine you see this in the C code:

```
CallX(0,"Hello");
```

It's a macro so read it as:

```
(*f->x)(0,"Hello");
```

You then need to find out what 'f' is. Looking back it turns out it is a structure of type FRED. FRED contains 3 functions, or to be more precise, FRED contains 3 addresses - one for each function x(), y() , z(). If FRED happened to start at memory address $1000 then the address of function x() would be at offset 0 ($1000), the address of function y() follows at offset 4 ($1004) and finally comes z() 4 bytes later at offset 8 ($1008). CallZ() [which is really (*f->z)()] is nothing more complex than

```
move.l $1008,a0
move.l (a0),a0
jsr (a0)
```

Forgive my assembler - it's been a long while, and the MWC assembler uses really odd syntax! The same applies to TPL. You have to go through it from the beginning figuring out what the offset is for each entry. Afair all the TPL offsets are 4 bytes.

Fine, but we need to know the real base address. This is where 'f' comes in. It holds a pointer to it. Let's say 'f' contains the value $2000 then (*f->z)() would be

```
X =0
Y =4
Z =8
move.l f,a0 /f
movel.l (a0),a0 /f->
adda.l #Z,a0 /f->x
move.l (a0),a0 /*f->x
jsr (a0) /(*f->x)()
```

The first few entries in TPL are:

```
typedef struct tpl {
/* offset */
/* $00 */ char *module;
/* $04 */ char *author;
/* $08 */ char *version;
/* $0C */ char* (*KRmalloc)(int32);
/* $10 */ void (*KRfree)(char *);
/* $14 */ int32 (*KRgetfree)(int16 x);
/* $18 */ char* (*KRrealloc)(char *, int32);
/* $1C */ char* (*get_err_text)(int16);
/* $20 */ char* (*getvstr)(char *);
/* $24 */ int16 (*carrier_detect)(void);
/* $28 /* int16 (*TCP_open)(uint32, int16, int16, uint16);
[etc]
[snip]
} TPL;
```

The base pointer is:

```
extern TPL *tpl;
```

The correspondong macros are:

```
#define KRmalloc(x) (*tpl->KRmalloc)(x)
#define KRfree(x) (*tpl->KRfree)(x)
#define KRgetfree(x) (*tpl->KRgetfree)(x)
#define KRrealloc(x,y) (*tpl->KRrealloc)(x,y)
#define get_err_text(x) (*tpl->get_err_text)(x)
#define getvstr(x) (*tpl->getvstr)(x)
#define carrier_detect() (*tpl->carrier_detect)()
#define TCP_open(h,p,t,o) (*tpl->TCP_open)(h,p,t,o)
```

So to call TCP_open() we fetch the pointer out of 'tpl', indirect through it to get the TPL base address. Add the TCP_open offset $28,

which gets us to the right part of the TPL structure. Read the
contents of the address there, then jump through it.

```
move.l tpl,a0 /tpl
move.l (a0),a0 /tpl->
adda.l #$28,a0 /tpl->TCP_open
move.l (a0),a0 /*tpl->TCP_open
jsr (a0) /(*tpl->TCP_open)()
```

>And input parameters to the functions,
>should they be put on the stack or in some data/address registers?

The stack. C functions push arguments right to left and the caller
gets to unstack them - just like Tos. To complete the above example:

```
uint32 a;
int16 b;
int16 c;
uint16 d;
TCP_open(a,b,c,d);
```

```
move.l tpl,a0 /tpl
move.l (a0),a0 /tpl->
adda.l $28,a0 /tpl->TCP_open
move.l (a0),a0 /*tpl->TCP_open
move.w d,-(sp) /push args
move.w c,-(sp)
move.w b,-(sp)
move.l a,-(sp)
jsr (a0) /(*tpl->TCP_open)()
adda.l #$0A,sp /pop args
```

I forget offhand what registers are preserved/destroyed. Probably the
same as a Gemdos call etc.

The function responsible for this mess. It's form_button() for the
buttons and for the cursor I have no idea... I fixed it by simply dissabeling
the cursor in the windows not being on top and enabled it when it gets
active/topped. You can only have keyboard input to the top window anyway,
I think...

You are wrong. ;-)

MGIF can be configured for 'point to type' (keyboard entry into the window
below the mouse pointer even if it is partially obscured).
I don't think I made this the default, though, since some people might get
confused (I'm used to X myself and even configure Win95 this way).

Naturally, you can't use the standard text cursor if you do this and the
current (even beta7+) XaAES (don't know about other alternative AESes) has
some trouble with it.

Yeah, I can not live withpout it under Solaris. I guess you have done your own
keyboard handling then. Because I'm almost 100% sure that normally they keyclicks
will go to the window on top. I have to try this...

> Naturally, you can't use the standard text cursor if you do this and the

So I wasn't completely wrong then.

Would I have to resolve an IP-address (like 123.456.789.012) before sending any data to a recipient? Isn't resolving actually for translating 'human' addresses (like www.anyhost.com) into IP-addresses using a DNS-server? My game would have to be able to quickly send data without confirming any connection otherwise the whole came would stop while connection is being established.

Well, I read in the docs something about the transfer of IP-packets being just 'above' the TCP,ICMP,UDP layers. So when sending an IP-packet you may choose which of the protocols to use. I didn't see anything about there being a handler to handle TCP packets, but I may have missed that.

> } TPL;

Does the STiNG-cookie contain a pointer to this tpl-structure? If so then i've understood how to call for example tcp_open. But I would still

need to know the essentials like if STiNG requieres a VBL-interrupt and
AES.

>

>
> Forgive my assembler - it's been a long while, and the MWC assembler
> uses really odd syntax!

Actually wouldn't it be right with:

move.l $1008,a0 get pointer at $1008
jsr (a0) use that pointer to jsr to

Thats the same way I call my joystick-reading routine in the game.

> So to call TCP_open() we fetch the pointer out of 'tpl', indirect

>
> move.l tpl,a0 /tpl
> move.l (a0),a0 /tpl->
> adda.l #$28,a0 /tpl->TCP_open
> move.l (a0),a0 /*tpl->TCP_open
> jsr (a0) /(*tpl->TCP_open)()

But isn't 'tpl' already the address to the whole tpl-structure? So
wouldn't
move.l (a0),a0
take out the first pointer in the tpl-structure, which is *module? You
said your assembler was a bit rusty, eh? ;-)
Or am i getting the tpl-structure all wrong?

And results of the function, can I fetch them from the stack too? Please
excuse my tiny knowledge of the C language.

I just checked in the 'eng_html.lzh' file. It said that i should use the
cookie to access the 'drv list' structure. In it there is a pointer to a
function called 'get_dftab' (i think it is at offset 10, if i'm not
misjudging the structure). i should jsr to that function with a pointer
to a string 'TRANSPORT_TCPIP', and will get back a pointer to the 'API'.

But the docs doesn't say where 'tpl' is to be found.

Hi

> Does anyone run STOS under Pacifist ? Could I have a look at your Pacifist
> config file,
> since I am having problems getting it to work.

I have just used standard PaCifiST settings....

what TOS version, and what STOS version are you using?

You probably want to upgrade your STOS, or downgrade your TOS (early STOS versions are incompatible with 1.62 - 2.06 versions [depending on which STOS you are useing]. Current STOS will work on them all of course.

2231. STiNG LocalTalk

Newsgroup: comp.sys.atari.programmer
Date: 1998-09-03 00:00:00 UTC
From: "K.Hampf" <k_hampf@yahoo.com>
Message-ID: <35ee408d.0@d2o29.telia.com>
Source record: 3846

Why is it that the LocalTalk module (by "Uknown Programmer") in STiNG has options for Ethernet-cards like VME and Riebl? What on earth has that to do with LocalTalk? The type is "serial bus type" which would be correct, but then you'd probably want to use a LocalTalk tranceiver for RS-422, but there's no option for Serial Bus Type on LAN ...
Is there serial bus type options that works in STiNG? Ethernet for example, does it work allright? If it does and you can select LocalTalk adapters, you can easily connect Mega STe's and Falcons by their LAN ports at least for raw TCP/IP, the AppleTalk protocool is a totally different matter.

Have you got a safety line instead.

>There seem to be four system variables associated with this:
>
>uint32 *memvalid =0x420;

You missed out these 2:

uint32 *memvalid2 =0x43a;
uint32 *memvalid3 =0x51a;

AFAIR memvalid3 is present, but unchecked, under TOS 1.0. It is checked
under TOS 1.62 and, probably, TOS 2+.

>uint16 *memctrl =0x424;
>uint32 resvalid =0x426;
>uint32 *resvector =0x42a;
>
>and the reset address for the cpu is:
>
>uint32 *resetpc =0x004;
>
>'memctrl' is a copy of the value which got written into the memory
>controller. I'll ignore it.

That's fine.
```

>'memvalid' is a flag denoting if the controller's config is valid. It
>must be - we're running, so I'll ignore that also.

Bad move. If memvalid == 0x31415926, memvalid2 == 0x237698aa and, for
TOS 1.6+, memvalid3 == 0x5555aaaa then a reset will be warm. If any of
these don't match the 'magic number' then a cold reset is performed.
The difference between a cold and warm reset being the check to find out
how much memory is available.

>'resvalid' denotes if the reset routine whose address is in
>'resvector' is usable or not. I assume this is the warmstart code.

Ooo, assumption is the mother of all programming nightmares. The reset
routine pointed to with resvector is one that is called before TOS is
initialized and has nothing to do with warm/cold resets. As an aside to
this, this is the way the ghost virus stays resident through warm resets.

>Also it makes sense that the next reset will be a warmstart unless we
>force otherwise.
>
>Finally, I have a vague recollection the value of PI is used to denote
>that 'resvector' is valid.

That's right.
> I also assume the contents of 'resvector'
>has already been set to a warmstart routine by the system.

See above for my feelings about assumptions :)

>The code, based on the above assumptions ...
>
>void
>Reset(bool coldstart)
>{uint32 pi =0x31415926L;
> void (*fcp)() =*resetpc;
>
> (void)Super(0L);
> *resvalid = coldstart ? ~pi : pi;
> (*fcp)();
>}

Almost right. The only thing wrong with the above is you're playing with
the wrong *???valid. The code required is almost the same, as below:

```
void
Reset(bool coldstart)
{uint32 valid =0x752019f3L; /* magic for memvalid */
void (*fcp)() =*resetpc;

(void)Super(0L);

/* clear memvalid. results in memory check/cold boot. */

*memvalid = coldstart ? ~valid : valid;
(*fcp)();
```

}

Still, since you didn't use the safety net, and therefore couldn't test
it, that's not too bad.

BTW, is the LAN port on the Falcon compatible with RS232 ? I mean I
would like try to connect my modem to the LAN port (with a Mac cable ?)
and then use the Modem2 to talk with a PC (using a nul modem cable I
suppose).
What would be the wiring between the modem (DB9) and the LAN port ?

BFN,
/Pascal/

>translating 'human' addresses (like www.anyhost.com) into IP-addresses
>using a DNS-server?

Yes, that's it exactly. Btw, addresses like 123.456.789.012 are known
as "dotted quads".

I believe you can send either type to the 'resolve' function. You
don't need a DNS server if you pass a dotted quad: obviously - there's
nothing to look up!

If you pass a normal human address, then the resolver will ask the DNS
server for the name's dotted quad. The DNS server address is in one of
the config files. Just look for NAMESERVER and put in the dotted quad
for the DNS server you want to use.

>My game would have to be able to quickly send data
>without confirming any connection otherwise the whole came would stop
>while connection is being established.

Before your game starts, you'll have used STiNG's dialler to connect
to your ISP. STiNG will then start talking to your ISP. It won't be
saying much - enough to prevent the ISP software hanging up the phone.

On the other hand, if you had your game running on two machines which
were connected directly together then there's be no dialling. You'd
just enable STiNG on both machines end they'd talk to each other -
enough to prevent the other one 'hanging up'.

Now you'd have the actual game start. It would open a connection to
the other machine(s) and they'd start talking.

>Well, I read in the docs something about the transfer of IP-packets

STiNG does it. The approach is similar to using files. TCP_open is
rather like Fcreate/Fopen, TCP_send is like Fwrite. There's other
stuff of course but essentially you have a handle, a buffer and the
buffer size. You stuff data into TCP_write and STiNG sends it.
Meanwhile anything STiNG receives gets bundled together internally
waiting for you to read it.

The design of TCP allows its data packets to find their own way
around. Certain packets might decide to take one route, other packets
could take another. There is no way to tell. This means they can
arrive in the wrong order. Some may arrive corrupted. Others may not
arrive at all. The corrupted and missing packets require a request be
sent to resend them. By the time your code gets data from STiNG all
these low level problems have been dealt with you'll no doubt be glad
to hear!

I don't know anything about ICMP I'm afraid. I think UDP is a lower
level protocol than TCP but I can't remember any details.

Yes, but indirectly. Amazingly I've located some code from ages ago.
Oh no you're probably thinking, "not more C" but further down - I've
had MWC output commented assembly. Like I said, the syntax is strange
but you'll no doubt find it easy to work out. ;-)

```
#include <stdio.h>
#include <osbind.h>
#include <stik.h>

DRV_LIST *drivers =NULL;
TPL *tpl =NULL;

typedef struct {
long cktag;
long ckvalue;
} ck_entry;

/*
Search cookie jar for stik cookie, save pointer in DRV_LIST above.
*/
static long
init_drivers()
{
long i = 0;
ck_entry *jar = *((ck_entry **) 0x5a0);

while (jar[i].cktag) {
/* CJTAG = "STiK" (without quotes) */
if (!strncmp((char *)&jar[i].cktag, CJTAG, 4)) {
drivers = (DRV_LIST *)jar[i].ckvalue;
return (0);
}
++i;
}
return (0); /* Pointless return value... */
}

/*
Set things up so our program can talk to stik. The init_drivers
code must run in supervisor mode (obviously).
*/
bool
stik_init()
{
Supexec(init_drivers);

/* See if we got a value */
/* ?did init_drivers set non zero in DRV_LIST?
if (drivers == (DRV_LIST *)NULL) {
fprintf(stderr,"stik_init() - init_drivers() failed\n");
return (false);
}

/* Check Magic number */
/* MAGIC = "STiKmagic" (without quotes) */
if (strcmp(MAGIC, drivers->magic)) {
fprintf(stderr,"stik_init() - Magic string doesn't match\n");
return (false);
```

```
}

tpl = (TPL *)get_dftab(TRANSPORT_DRIVER);
if (tpl == (TPL *)NULL) {
fprintf(stderr,"stik_init() - TPL load failure\n");
return (false);
}

fprintf(stdout,"TPL up, Author %s, ver
%s\n",tpl->author,tpl->version);

return (true);
}

The dialler/config is a Gem program and there are a couple of CPX's so
in that respect the AES is needed. However, most of the information
they work with exist in simple text files which you can set manually.
That just leaves the dialler. Maybe you could dial then run your game?

As for interrupts, I'm really not too sure. I'll stick my neck out
here and say that it is interrupt driven but I don't know any more
than that. Perhaps you could write a small command line driven STiNG
test program, try it under Gem with STiNG running as normal. Then try
it with your game and Pexec() the test program - see if it still
works?

Definately!

>Or am i getting the tpl-structure all wrong?

Nope, just one level of indirection out. :-)
Your code needs to store a pointer to the TPL structure.

typedef struct {
int x; /* 2 bytes */
} FRED;

main()
{FRED f; /* whole structure (2 bytes) */
FRED *ff; /* pointer (4 bytes) to structure but garbage atm */

ff = &f; /* ff now valid */

f.x = -5;

ff->x = -10; /* overwrites the -5 */
}

/ line 1: source file 'c.c'
/ module name c

.shri

.globl main_
main_:
/ line 6: 'main_' func int:2
link a6, $-6
/ line 6: '{'
/ line 6: auto -2 'f' struct:2 '.1'
```

```
/ line 7: auto -6 'ff' ptr:4 struct:2 '.1'

/ line 9: ';'
lea -2(a6), a0
move.l a0, -6(a6)

/ line 11: ';'
moveq $-5, d0
move d0, -2(a6)

/ line 13: ';'
movea.l -6(a6), a0
moveq $-10, d0
move d0, (a0)

/ line 14: '}'
unlk a6
rts

/ line 3: typedef 'FRED' struct:2 '.1'
/ line 3: struct '.1' struct:2 1 {
/ line 2::0 'x' int:2
/ }
```

Hey, this is good. I don't have to write any assembler and get it
wrong! <G>

>And results of the function, can I fetch them from the stack too? Please
>excuse my tiny knowledge of the C language.

oops, forgot all about that! This one's easy - register d0, either as
a 16 bit or 32 bit value. It doesn't matter what 'type' the C source
code says it is. If the value boils down to a WORD then it'll be in
d0.w (high word is undefined), and if it boils down to a LONG then
it'll be in d0.l. As pointers are always 32 bits on the Atari then
they'll always be d0.l as well.

Strictly speaking, a C compiler can use any method it wants but
fortunately there is a standard method which can be forced upon the
compiler. This standard is:

Push arguments starting with the rightmost argument and work left.
Caller must pop the arguments.
Result returned in d0.w or d0.l
'char' is extended to 'int' (ambiguous - more below).

On the Atari the keywords 'cdecl' and 'stdargs' usually appear along
with the functions in the header files. They tell the compiler to use
the above convention.

The ambiguous bit ...

The basic unit in C is the 'char'. C has a function called sizeof()
which simply returns how much space a particular datatype uses in

chars. C has no definition of how big a char is in bytes. All it says
is that sizeof(char) == 1. A char could take 13 bits for all we know!
Another rule says this:

sizeof(char) <= sizeof(int) <= sizeof(long)

Thus, in theory a char could take up the same space as a long. This is
a pain so various conventions are used to denote how much space is
really used so people with different compilers know when to make
adjustments. On the Atari ...

char (signed or unsigned), 8 bit.
long (signed or unsigned), 32 bit.
int (signed or unsigned), 16 or 32 bits. You have to know which
compiler produced the code. :-(

So people (should) use these instead:

int8 signed 8 bit value
uint8 unsigned 8 bit value

WORD = int16 signed 16 bit value
LONG = int32 signed 32 bit value

UWORD = uint16 unsigned 16 bit value
ULONG = uint32 unsigned 32 bit value

Therefore we all know what we're talking about!

>I just checked in the 'eng_html.lzh' file. It said that i should use the
>cookie to access the 'drv list' structure.

Yep.

>In it there is a pointer to a
>function called 'get_dftab'

Yep.

>(i think it is at offset 10, if i'm not
>misjudging the structure).

It is.

>i should jsr to that function with a pointer
>to a string 'TRANSPORT_TCPIP',

Yes.

>and will get back a pointer to the 'API'.
>But the docs doesn't say where 'tpl' is to be found.

Hmm, the API pointer you mention is what I'm referring to as the TPL
pointer! This is confirmed in the source code way back near the
beginning of this post.

I'm using an old header file for STiK. STiNG is backwards compatible
so I don't think it is a problem this early in the game - but it might
be going under a different name. It would be odd but not impossible.

Just to double check, do a search through the header files using
"extern" as the search word. You should come across this:

extern TPL *tpl;

If you don't, can you post what does match "extern" please?

oo - what a long posting! <G>

I can't remember what I did with my cursor. It either behaves like
yours or is displayed only when the whole edit field happens to be
visible.

>You can only have keyboard input to the top window anyway,
>I think...

Er, I can't remember! It's not that I know the answer. I do remember
that I don't. What I can't remember is if I had the cursor active in
the background just in case it turned out to be possible, or whether
or not I bothered ... or not.

If I had better sense I'd be dragging this post to the trashcan! <G>

I thought myself out of that one. It kept nagging me at the back of my
mind that memory config was the key. Then the thought went away and I
was happy again.

>>'resvalid' denotes if the reset routine whose address is in
>>'resvector' is usable or not. I assume this is the warmstart code.
>
>Ooo, assumption is the mother of all programming nightmares. The reset

... and it was this bit of documentation that made the above thought
go away. Darn.

> Yes, that's it exactly. Btw, addresses like 123.456.789.012 are known
> as "dotted quads".

I saw something about 'dest_host' when using TCP_open, and it was a
32bit value. Does it mean that the dotted quad is that value, or is the
value a pointer to a string that is for example '123.456.789.012'?

> >My game would have to be able to quickly send data

> saying much - enough to prevent the ISP software hanging up the phone.

I didn't mean that. What i meant was that, when using TCP_open to alert
the destination that there is data coming (I guess that it's used that
way anyway), does the TCP_open call halt the whole system while it waits
for an answer? If it is that way my game would halt during that time,
and then suddenly continue. Very annoying.

> On the other hand, if you had your game running on two machines which

> enough to prevent the other one 'hanging up'.
>
> Now you'd have the actual game start. It would open a connection to
> the other machine(s) and they'd start talking.

Yes, i've already thought about it for awhile. Mario Becroft's game
'Manouver' uses a technique where one of the two computers waits for the
other to send him some sort of alert message. I guess he uses TCP_open
and then TCP_send to send the computer's address to the other recipient.
My game, in which I want as many as 8 players, one of the computers
would have to act as the 'master' and the others as 'slaves'. The master
would then just have to sit and wait for the slaves to alert him,
telling him their addresses.

> STiNG does it. The approach is similar to using files. TCP_open is

I just hope that it isn't exactly like Fopen, because then there would
be that infamous delay which I don't want.

> The design of TCP allows its data packets to find their own way

> these low level problems have been dealt with you'll no doubt be glad
> to hear!

So I won't have to check wether the data is alright, since STiNG has
already requested a resend? Yes, I'm glad to hear that. :-)
It doesn't matter which order they appear. I'll just add some type of
clock-value to the string i'm sending. The recipient will then know if
to use the data coming in or to ignore it. Since the game is a racing
game of type 'Lotus' the cars may jerk a bit, if the connection isn't
fast enough, but that's the players' problem. ;-)

> but you'll no doubt find it easy to work out. ;-)

> Is the above in any way helpful?

Ermm, no... ;-) Sorry
Maybe it would be easier with a pseudo-code example. All I need to know
is what to do in some easy steps. The docs just said that there were
"some strings to check". It didn't say what strings, at which offset,
and what they should be.

> That just leaves the dialler. Maybe you could dial then run your game?

Yes, of course the game would have to rely on the user already having
established the connection. What I really need to now is if the
STiNG-core uses AES-events for its main loop. And what interrupts it
uses. If it uses Timer A for DMA-operations then I'm out of luck,
because I think that's the way the sound-module replay routine transfers
sample data to/from the DSP. (I use the excellent replay rout by
BiTMaSTeR/TCE)

So when there's just about success/failure then the low word of d0 will
contain zero for success and -1 for failure (or is it the other way
round?)

Good you told me, that 'cdecl' was getting on my nerves since I couldn't
figure out what is was for. :-)

It's also good that I've just started attending a course in C++
programming. Now I'll be able to figure things out myself. ;-)

> Hmm, the API pointer you mention is what I'm referring to as the TPL
> pointer! This is confirmed in the source code way back near the
> beginning of this post.

Excellent! Then I think I'm beginning to get the idea of how to make the
whole thing work. :-)
So to sum it all up: the cookie contains a pointer to the DRV_LIST,
which contains a pointer to a function get_dftab, which, if called with
a pointer to a string 'TRANSPORT_TCPIP', returns a pointer to the API
(TPL) structure. And from there on it's just straight autobahn. ;-)

Thanks for all your help!!! :-)

the dotted quad is the value. Each of the numbers in the dotted quad
is simply an 8 bit number, meaning the above one is impossible :-)

so for an address of 149.76.12.4 you would use the value $954c0c04

> I didn't mean that. What i meant was that, when using TCP_open to alert
> the destination that there is data coming (I guess that it's used that

TCP_open opens a connection to the destination that stays open until you
close it with TCP_close or the other end closes (in which case you will
receive an error when trying to read/write to that handle)

> way anyway), does the TCP_open call halt the whole system while it waits

To actually know there is data to read you will need to check yourself,
either by trying to read the data, or by using CNbyte_count.

David

Yes. Btw, each of the four parts of the dotted quad take values in the
range 0..255 thus 9.10.254.11 is $09.$0A.$FE.$0B and is simply passed
to TCP_open as $090AFE0B

>or is the
>value a pointer to a string that is for example '123.456.789.012'?

You get the dotted quad from the resolve() function. The third
argument is the address to which you want the quad written. Just read
the quad and pass it to TCP_open.

>I didn't mean that. What i meant was that, when using TCP_open to alert
>the destination that there is data coming (I guess that it's used that
>way anyway), does the TCP_open call halt the whole system while it waits

I dunno if TCP_open blocks or not (it has different modes) but it
doesn't matter as it would be part of the game initialisation and not
be closed until the game finished.

TCP_open establishes a connection to a "socket". There are various
sockets with different purposes. For example, if you wanted to send an
email you'd connect to socket 25 which knows about the necessary SMTP
posting commands. When you're done you'd use TCP_close to disconnect
from the socket. Beware that either end can disconnect from the socket
at any time. Hopefully they do this gracefully by telling each other,
but sometimes this isn't possible (one end might have crashed) thus
TCP has to rely on timeouts. If one of these triggers your code may
have to decide on the action to take - try again - give up etc.

Assuming there's no problems, the main part of your game would send
data using TCP_send. STiNG constructs the TCP packets and 'injects'
them into the socket. They find their own way to the destination.

Receiving is similar. STiNG looks at the TCP packets that arrive.
Packets that aren't meant for this host (ie they don't match the
dotted quad) either get thrown away or are routed to somewhere closer
to where they should be going. The ones that match get stored awaiting

your code to read them. Use the CNxxx() functions for this (eg
CNbyte_count() - it doesn't block if no data is waiting).

>Yes, i've already thought about it for awhile. Mario Becroft's game
>'Manouver' uses a technique where one of the two computers waits for the

This is a bit tricky, mainly because I have little experience in this
area. ;-)

You resolve the hostname and get a quad. You then open a connection to
a socket using that quad. Somehow the two machines are talking.
Ordinarily STiNG acts as a client and relies on your ISP to figure out
the rest but it can act as a server. I think one of the machines
running the game will have to act as a server, the others will be
clients. It doesn't matter which one of them takes on the job of
server as long as one of them does and none of the others do.

I really am treading on thin ice here - I could be wrong!

>My game, in which I want as many as 8 players, one of the computers
>would have to act as the 'master' and the others as 'slaves'. The master
>would then just have to sit and wait for the slaves to alert him,
>telling him their addresses.

Although I know nothing about UDP I think it is worth investigating
further. I believe it is less complex than TCP and may allow you to
let all the machines talk without the complexities of servers etc.
Again, I could be wrong but I'd hate to think of you going to all that
trouble only to find UDP was a much better solution.

Nope. :-)

CNbyte_count() returns negative if there's an error, the number of
bytes waiting if positive, and zero if there's nothing. It returns
immediately.

Correct.

>It doesn't matter which order they appear.

They'll come out of STiNG in the same order they went in. If a packet
in the middle goes missing you'll not be able to get at the ones after
it until the missing one arrives.

>I'll just add some type of
>clock-value to the string i'm sending. The recipient will then know if
>to use the data coming in or to ignore it.

The paragraph above might annoy you then. Don't worry though. In
reality, if a packet doesn't arrive then usually none of the others do
because the most likely cause is network delays. If that isn't the
problem then the missing packet will turn up so quickly you'll not
notice.

>Since the game is a racing
>game of type 'Lotus' the cars may jerk a bit, if the connection isn't
>fast enough, but that's the players' problem. ;-)

Yes. :-))

Besides, if you're not transmitting much more than movement
information then network delays becomes the only important factor.
There'll be no strain on the telephone line.

>> Is the above in any way helpful?

>
>So when there's just about success/failure then the low word of d0 will
>contain zero for success and -1 for failure (or is it the other way
>round?)

It depends on the compiler. C defines false to be zero and true to be
any values that are not false (it makes sense - really). Simply test
for "not zero" and you'll be fine.

In practice:
Typically, false=0 and true=1 but all too often you'll find true=-1
(logical !false is 1, whereas bitwise ~false is -1). As the boolean
datatype is usually defined in terms of 'int' then bool might be a 16
or 32 bit value giving us four probable 'true's ...

$0001
$FFFF
$00000001
$FFFFFFFF

Hence testing for "not zero" is a really good idea!
Use "not zero" unless docs specifically state different.

>It's also good that I've just started attending a course in C++

Games programming? Your best choice would be STOS.

>Mais aussi des petits programmes que je peux lancer sous works ou sous
>windows par exemple.

Ah, serious programs! Many people use C. If you use this too you will
be able to get a lot of advice and help.

If you do not want to spend much time learning you may be better using
a Basic. Have you programmed before? If so I guess you will know some
Basic already.

A bientot, chouchou.

If you don't bother to read the news, you shouldn't post questions there
in the first place.

Interrupt programming is a bit tricky, since everything must be right, and
you need to worry about all time behaviour, CPU registers usage, stack access
etc. of the code. For this reason, I always write wrapping code in assembler
if some C code is to be executed from an interrupt. That wrapping code does
all the installation, and saves/restores registers etc. You need to know your
compiler *very* well if you attempt to do it without.

No, there aren't, not even with the reasons you stated here. If caching
filesystems are used, a RESET can leave a bad mess on the harddisk that
is, if things go bad, not recoverable. I would never, ever let any exe-
cutable on my hd do a RESET, apart from the proper shutdown tool. If I
find a program that does, it won't stay on my hd any longer.

> if you find someone is tampering with your
> file then theres nothing better than a reset to put them off messing..

It's useless, as after the RESET it will succeed doing it.

Good move ... ;-)

> I code exclusively in assembly-language.

Have you checked Ronald Andersons STNGPASM package, which contains assembler
libraries for programming STinG ? Find it on my web page for instance.

> be the first to be executed each VBL, to avoid flickering on the screen.

STinG runs from the 200 Hz system timer interrupt.

> 2. Is STiNG relying on AES events to run? I turn off AES in the game, so
> the OS won't do anything to my screens.

No. TOS programs using STinG are perfectly possible. Currently, you only
need AES for running STING.CPX at boot time to set STinG active (unless
you do not want to do it yourself in your code by using the appropriate
STinG call), and AES is not needed anymore afterwards.

> 3. I've understood so far that it might be a good idea to let STiNG call
> a handler to take care of incoming IP-packets, and that I can patch in
> my own handler. It's just that the few examples available is in C. Where
> should the handler expect to find the pointer to the IP-packet?

It depends on which protocol you want to use. Most likely, it's TCP. For TCP
the interface does not support callback functions. You can use callback
functions for ICMP or IP though. Whether it's feasible to use IP directly
depends on the type of your game, if it allows to run other software parallel,
you should not use it. This means no callback. However, the CNget_NDB() is
very efficient, so you might want to call it from your VBL code. That avoids
callback.

> 4. How do I call the different functions of STiNG in assembler? I saw
> something about 'jsr to the required function', but where are the
> pointers to these functions? And input parameters to the functions,
> should they be put on the stack or in some data/address registers?

The functions are declared classic C style, i.e. parameters go on the stack.
For the functions pointers, see the C example code that comes with STinG.
Basically, the STiK cookie holds a longword that is a pointer to a structure.
This structure contains a function pointer which must be called to gain the
address of the array of function pointers. See STING.HYP for a more elaborate
explanation. You do not need to bother with this scheme though if you use
Ronalds assembler library.

Yes.

> don't need a DNS server if you pass a dotted quad: obviously - there's
> nothing to look up!

Wrong. If resolve() is called with a dotted quad, it will still attempt
to figure out the mnemonic name (domain name) associated with that address
- basically the usual resolve function the other way round.

> The design of TCP allows its data packets to find their own way
> around. Certain packets might decide to take one route, other packets
> could take another. There is no way to tell.

This is more a feature of IP, rather than TCP. TCP acts to make this
invisible for the user.

> This means they can
> arrive in the wrong order. Some may arrive corrupted. Others may not

> these low level problems have been dealt with you'll no doubt be glad
> to hear!

Then why scare him with it ? ;-)

> I don't know anything about ICMP I'm afraid.

Conceptually, ICMP is above IP, but by definition it is a part of it. It
is a control protocol used to transmit simple network related messages.

> I think UDP is a lower
> level protocol than TCP but I can't remember any details.

UDP is on the same level as TCP, but provides much less features.

Oops, should have said that too in my other message, so I'm glad you
pointed it out, Guy. Should add that pointers too are returned in d0

(not a0 as assembler programmers might have guessed).

Bad move ! Steve Adams had a reason why he wanted programmers to fetch
the TPL pointer via the get_dftab() function ! And that same reason made
me decide to take out the TPL pointer array from the DRV_HDR array
entirely, since it only tempts the programmer to access it directly.

It's the value. The dotted quad is merely a convenient way to write the
IP address, which by definition is a 32 bit word (not 4 bytes).

>> >My game would have to be able to quickly send data

> and then suddenly continue. Very annoying.

No. Apart from the calls that carry the word "wait" inside their name
(TCP_wait_ack() for instance) and resolve, no call is blocking, they
all return immediately.

> My game, in which I want as many as 8 players, one of the computers
> would have to act as the 'master' and the others as 'slaves'. The master
> would then just have to sit and wait for the slaves to alert him,
> telling him their addresses.

Then you'd do a passive TCP_open at the master's side, i.e. the master
will become the server. It can simply try to receive data (will get a
E_LISTEN error code as long as not connected), or call TCP_wait_state()
to wait for the TESTABLISH state.

>> STiNG does it. The approach is similar to using files. TCP_open is
>> rather like Fcreate/Fopen, TCP_send is like Fwrite. There's other

It's done in the background, so no delay. Check out from time to time if
you're connected.

> So I won't have to check wether the data is alright, since STiNG has

> to use the data coming in or to ignore it.

With TCP, that is not necessary. TCP ensures correct order.

> But an answer from Peter Rottengatter would of course be the best. Isn't
> he the one who coded the whole thing?

Yes. With the exception of the resolve() code which is by Ronald Anderson.

> So when there's just about success/failure then the low word of d0 will
> contain zero for success and -1 for failure (or is it the other way
> round?)

It depends on the function you're calling. Check out the docs. Functions
that only return error codes will return E_NORMAL for success, which is
#define'd to zero.

> find a program that does, it won't stay on my hd any longer.

In fact, i'm coding a shutdown tool working under plainTOS. The MagiC shutdown
with the STOP folder is a great idea because i can update some of configuration files
during the shutdown. I want extend this idea to TOS. Eg: when i start a
TOS session, i use a personal environement, for that purpose, i use a login program,
a set of environemental variables (HOME,USER,...) and a logout program. If
i modify my NEWDESK.INF, during the shutdown this file is copying in a special
folder (in my home dir, depending on $HOME). In the next session, during the
login session, this file is copying in my root directory. The reset is used
with plainTOS (not multitasking system) by logout to complete the shutdown and restart
the system.

It seems complex, but with two very simple programs, i have a multiuser environmental
with MagiC, MultiTOS and TOS. Each user has to edit 2 files: login.cnf that performs
somes action during boot and logout.cnf that performs some actions during shutdown.
There is a third file 'login.usr' that describe each user (as /etc/passwd in unix).

If you are interesting in, i'll put this on my web page. But currently it is just
a personal usage.

Yes!!! Then it will surely work with my game! :-)
Because the only interrupts I change during startup is the vbl-vector,
and BiTMaSTeR's replay routine probably uses some DMA-interrupt to feed
the DSP.

So is it a 32bit longword where each byte is one part of the dotted
quad, or would i just have to add the parts together?

> I dunno if TCP_open blocks or not (it has different modes) but it
> doesn't matter as it would be part of the game initialisation and not
> be closed until the game finished.

So you mean that i wouldn't have to call TCP_open everytime i want to
send something, i would only have to do it once and then the 'channel'
would stay open? Can i have several connections open at once?

> TCP_open establishes a connection to a "socket". There are various
> sockets with different purposes. For example, if you wanted to send an
> email you'd connect to socket 25 which knows about the necessary SMTP
> posting commands.

Is there some definition of which sockets i can use for my game? I saw
that Mario Becroft's game 'Manouvre' uses socket 13013. Can I use that
one too, or is it only for his game from now on?

> When you're done you'd use TCP_close to disconnect

Does CNbyte_count() return how many bytes there are to read in total, or
how many bytes to read in this 'block'? If the later is true, would I
then have to call CNbyte_count several times until it tells me that
there are no more blocks for me to read?
Does CNget_NDB return the address to the string?

> CNbyte_count() returns negative if there's an error, the number of
> bytes waiting if positive, and zero if there's nothing. It returns
> immediately.

And how do I get the address from which I should read the data? (already
asked this earlier)

> They'll come out of STiNG in the same order they went in. If a packet
> in the middle goes missing you'll not be able to get at the ones after

> >
> >I just thought of that. :-)

I've written a small program that as yet only does the setup. It works
fine, it finds the cookie, calls get_dftab, and also prints who made the
tcp-layer and what version it is. Now i need another falcon to test this
whole thing in a small network. Had better get it.

> >Excellent! Then I think I'm beginning to get the idea of how to make the

2259. Bus Error when calling Rsrc_gaddr()

Newsgroup: comp.sys.atari.programmer
Date: 1998-09-08 00:00:00 UTC
From: barrilli@club-internet.fr
Message-ID: <6t1um7$83v$1@front4.grolier.fr>
Source record: 3774

Hi everybody,

Sorry to ask for such a simple question but I'm learning GEM, I'm programming my fist dialog box with buttons, file selector and editables, and there's a strange thing :
when calling Rsrc_gaddr(), it bombs (2 -> bus error). I tried to find what's the matter but I've got no explanation by now.

I made my ressource file with Ressource Construction Set v3.0

This is a sample of my source :

```
/* AES init */
ap_id=appl_init ();

/* VDI init */
v_opnwk ( work_in, &handle, work_out);

/* mouse -> arrow */
graf_mouse (0, 0L);

/* load .rsc file */
if (!rsrc_load ("convaxen.rsc"))
form_alert (1,"[3][Impossible de charger|CONVAXEN.RSC ![DIANTRE]");

else /* get the adresse of the dialog box DIALOGUE */
if (!rsrc_gaddr (R_TREE, DIALOGUE, dial_adrs)) /***IT BOMBS HERE***/
form_alert (1,"[3][Mauvais fichier|ressource ![GARGL !]"); /*error*/
```

I've no problem when compiling/linking (variables defined, convaxen.h included, etc).
Any idea or I'll have to tell Scully & Mulder about this affair ? ;)

Thanks for answers !

Vincent

2260. Re: Bus Error when calling Rsrc_gaddr()

Newsgroup: comp.sys.atari.programmer
Date: 1998-09-08 00:00:00 UTC
From: barrilli@club-internet.fr
Message-ID: <6t21b5ags1@front4.grolier.fr>
Source record: 3775

```
Me again ;)

I've found the error : the right call is
Rsrc_gaddr ( R_TREE, DIALOGUE, &dial_adrs);
^
the prototype is int rsrc_gaddr( int re_gtype, int re_gindex, void *gaddr );

BUT I have defined dial_adrs : OBJECT *dial_adrs so I don't find it very
logical to re-precise it ! As an example, we don't write :
char *source;
char *dest;
...

str_cpy(&dest,&source) but str_cpy(dest,source) without '&' ...

Vincent
```

2261. Re: STiNG-programming

Newsgroup: comp.sys.atari.programmer
Date: 1998-09-08 00:00:00 UTC
From: mb@tos.pl.net
Message-ID: <RQF2CW@tos.pl.net>
Source record: 3776

: So is it a 32bit longword where each byte is one part of the dotted
: quad, or would i just have to add the parts together?

As you could have seen in the example, each number in the "dotted decimal" IP address is one byte in the 32-bit longword.

: So you mean that i wouldn't have to call TCP_open everytime i want to
: send something, i would only have to do it once and then the 'channel'
: would stay open? Can i have several connections open at once?

In STiK, TCP_open() is a function that opens a connection so that you can send data to it, and read data from it. It's rather like opening a file. Once it's open, you can send and receive as much or as little data as you want, when ever you want. You can open any number of connections at once.

In a game such as you are suggesting, a sensible method would be for each of the slaves to open a connection to the master. Each slave would have one connection open, while the master would have many connections open - one for each slave. You would probably open the master first, which would listen for connections from a slave. When a slave is started up, it would open a connection to the master. That connection would only be closed when the slave or the master exits.

Presumably the master would keep track of the game parameters. So if your game included moving objects, for example, the master could calculate the positions and continually update all the slaves as to the current position. And when ever a user on one of the slaves performs an action such as moving the joystick, or whatever other inputs your game uses, it would send a message to the master telling it about the change. All this communication would take place over the sockets that were opened at the beginning, when each of the slaves was loaded.

: Is there some definition of which sockets i can use for my game? I saw
: that Mario Becroft's game 'Manouvre' uses socket 13013. Can I use that
: one too, or is it only for his game from now on?

To be honest I have no idea how one should really go about assigning a port number. I just picked that value out of the air. But there shouldn't be a problem, since in my networkable game the user can enter his own port number. This would be useful if the user wanted to run multiple copies of the game at once, each connected to a different person. In such a case the user could enter a different port number for each copy.

Some port numbers, especially the lower ones, are already reserved for various uses. For example port 25 does SMTP, for transporting mail, ports 20 and 21 are for ftp, and 23 is normally used for telnet. User software should normally use higher port numbers.

I admit I'm not extremely familiar with this area, and someone who knows
more about it would be better able to advise you.

: Does CNbyte_count() return how many bytes there are to read in total, or
: how many bytes to read in this 'block'? If the later is true, would I
: then have to call CNbyte_count several times until it tells me that
: there are no more blocks for me to read?

Don't worry about the behind-the-scenes operation of the connection. You
simply think of it as a stream. CNbyte_count() tells you how many bytes
are waiting, it's as simple as that.

: > CNbyte_count() returns negative if there's an error, the number of
: > bytes waiting if positive, and zero if there's nothing. It returns
: > immediately.

: And how do I get the address from which I should read the data? (already
: asked this earlier)

The number of bytes waiting is the return value from CNbyte_count().

: I've written a small program that as yet only does the setup. It works
: fine, it finds the cookie, calls get_dftab, and also prints who made the
: tcp-layer and what version it is. Now i need another falcon to test this
: whole thing in a small network. Had better get it.

You could always run two copies of the program on a single machine. This
is how I tested my networked game during development, and I found it much
easier to do this than set up two separate machines.

What rsrc_gaddr() returns in gaddr depends on the value of re_gtype.
For values between 0 and 6 it return the address of the pointer, for
other values the content of the pointer.

> char *dest;
> ...
>
> str_cpy(&dest,&source) but str_cpy(dest,source) without '&' ...

Of course you don't call strcpy() this way, but there's a big difference:

strcpy() just needs a pointer to some string, i.e. the address of the string in memory. strcpy() therefore isn't able to alter the value of your stringpointer, but only the memory it points to. You don't expect dest or source to have another value after calling strcpy(), do you? But you do so for the rsrc_gaddr()-call and your tree parameter.

For rsrc_gaddr() to retrieve the address of an object tree, you want to receive a pointer to the tree. If you then only pass the address of another tree in memory, rsrc_gaddr() will still treat it as a pointer to a pointer to an object tree, as it couldn't return you the address otherwise.

An example: You do the following:

```
OBJECT *tree;

tree = 0L;
rsrc_gaddr(R_TREE, INFO, tree);
```

This will cause a crash because rsrc_gaddr() expects OBJECT ** and therefore tries to store the address of your INFO-tree in address 0L, because you only passed tree "by value".

```
rsrc_gaddr(R_TREE, INFO, &tree);
```

This is OK, as you pass the address of your pointer to rsrc_gaddr(), and it's then able to store the address of your INFO-tree where you want it, because you passed tree "by reference".

strcpy() only needs the pointers passed "by value", because it does not want to change dest or source for you.

It may be easier to understand if you don't look at pointers, but at - say - integers:

```
void f1(int number)
{
number = 0;
}

void f2(int *number)
{
*number = 0;
}

int main(void)
{
int a;

a = 5;
f1(a)
printf("a = %d\n", a);
f2(&a);
printf("a = %d\n", a);
return(0);
}
```

You'd never expect a to be different after calling f1(), and that's exactly what happens. But after calling f2(), a has the value 0, because you passed it "by reference" to a function which expects a pointer to an integer. f2() therefore didn't receive 5 as its parameter, but for example 0x10000L, the memory address where the value 5 of a is stored. Inside, f2() doesn't alter its argument, but the value it points to.

In this example, f1() is like strcpy(), f2() like rsrc_gaddr().

Hope that clears up things a bit.

Ciao

Thomas

In order to do that, wouldn't I have to assign each of the two programs
a different IP? But STiNG only allows one IP/computer, or am I wrong?

2268. Lattice C bugs on big projs

Newsgroup: comp.sys.atari.programmer
Date: 1998-09-09 00:00:00 UTC
From: michael@fastlane.net
Message-ID: <234C8851B63EC0EA.D58EE0EA48355F04.2DD85DFEDA3D722A@library-proxy.airnews.net>
Source record: 3783

Hey all,

Anyone out there using Lattice C 5.6 on any large (>285 .c files) projects?
It seems to crash when attempting to edit a large project. It also fails
to link properly by refusing to see the math library. And yes, the
libraries are in the order recommended by the manual:

CSNB.O

<about 435 .c files>

LCGSNB.LIB
LCMSNB.LIB
LCSNB.LIB

If no one has a solution to this, does anyone out there use makefiles
with Lattice? Specifically, I need a makefile that will recursively
do makes. I can do it with gcc/make, but I'm not quite sure about lc.ttp
and clink.ttp with make.

Thanks in advance,

Michael White (michael@fastlane.net)

2269. New release of the Visual Assembler

Newsgroup: comp.sys.atari.programmer
Date: 1998-09-09 00:00:00 UTC
From: Benoit Perrin <genwax@geocities.com>
Message-ID: <35F682B2.167EB0E7@geocities.com>
Source record: 3784

Hi Atari programmers,

the new release of the Visual Assembler 4.5 pl0 is now available.
Here is a summary of the capacities of this version:

http://www.geocities.com/SiliconValley/Bay/1209/visualuk.html

Version 4.5

4.5 Release 00 by Wax & Gen 7/IX/1998

After nearly one year of hard work, here comes the first Object Oriented
Assembler Programming Environment.
[NEW]

* Kernel entirely re-viewed with an "object oriented" programming
method.
* Open/evolutive architecture which will allow Network Distributed
Applications. (every method-call is like a system message)
* Permits easy class creation and inheritance. (no multiple
inheritance
for the moment)
* Permits object encapsulation.
* Numerous facilities for programmers compared to C++ thanks to the
"local method list".
* Permits easy class import and creation.
* EXCLUSIVITY : the non blocking drop down window-menu. (try it with
wind1-menu in SRC/START)
* Infinite Timer and MouseZone automatic sharing to get rid of the
GEM
limitation. (easy thread programming)
* New library : "Workspace", for programs which need atom-malloc
facilities. (for neuron simulation for instance)
* Intelligent internal V.A/programmer error detection with
illegal+explanation in (a6).
* Extended debugging with Alert boxes showing methods, parameters ...
* Easy debugging in window with the VA-LOGGER. (a program to be put
in
accessory)
* User debug messages are possible using the VA-LOGGER. (sources
included
of course !)
* Keeps the VA 4.1 tree construction for GEM windows, children
windows
and children objects.
* Warning : Children windows are not yet available in this version !

```
* Warning : The windows toolabrs are not available in this version,
they
need the Children Windows.
* Warning : Chained-text object not available in this version !
* Minor bug introduction ;-)

and many more ... lots of libraries, functions and methods.

>How do I get a bigger list items without having to create a 1000 lines
>RSC tree ;)

Strange idea. That will cost a lot of memory to handle 1000 GEM
objects.

A better method is to create only 10 or 15 object for the pop-up, and
you modify them dynamicaly before displaying to screen.
That means writing your own pop-up function, with important variables
such as the start number, an internal table...

Wana have mine in GFA Basic?
(the Joe's calling module pop-up is a good exemple)

Au revoir

Kaffe (a JVM with 68k JIT) is ported to TOS/MiNT, but you'll need
atleast a TT with 16Mb (atleast) to use it. And there's no AWT, so
it's not very useful (yet).

I don't know if it's released yet, but if anybody is interested then
mail me and I can ask the author.

I don't know if a JDK is available, but I would guess that Sun's javac
is ported (isn't the source available?).

Michael,

You need to be more specific about when Lattice crashes. Is it when
you try and add more c files ...? Isn't >285 a bit excessive? If
that really is the problem why don't you just combine the source
files to a more workable number or make a library. I have a project
that produces a 400K executable without any problems; no problems
with the math library either. If your project file is flakey, it
could easily produce all kinds of errors in the final link.

Source record: 3788

Hi, I have a little problem.
I think menu_popup() is the way to go without going with my own lib.
How is it possible to have:
A list popup (very long list, like 300 items) with the scroll bar?
SO far what I get is the scrollbar but up to the maximum of my RSC
height only. (which is 20 lines right now).
SO it works, but display 8 items out of 20.
How do I get a bigger list items without having to create a 1000 lines
RSC tree ;)

Thanks.

I think the only way to have JAVA on a Atari is to use Linux, but it's no
more TOS ;)
Langages on Atari are
asm68k, C, C++ (gnu), pascal, gfa-basic, omikron-basic, STOS basic, forth,
lisp, Eiffel (contact me if you want it !) , maybe other ones ...

Vincent

You need to create a tree that contains all items you want to display.
E.g. if you have 1000 items, then you need a 1000 lines high box with
1000 strings.

The popup-tree is very simple, so in your case I would suggest to
create it at run-time, perhaps everytime you need to display it
(depends on how static the contents is). Read the relevant docs in the
Compendium carefully first...

There is no Java for TOS, as it would be too slow and power consuming.

On the Atari Platform you have access to Basic, GFA Basic, C, Assembly,
Pascal, Lisp, etc...

Ah. That makes a lot of sense. It also explains why Henrik could not
find it. I was relying on some old STiK code from way back!

An attempt at the reverse actually. I formed the impression he *might*
be thinking his code had to deal with some of these issues. It seemed
easier to state what some of the problems were then say "forget all
about it" ;-)

Am I correct in thinking it is less prone to network delays - but at
the 'expense' of TCP?

ie I read some news article somewhere, where someone was moaning that
UDP was slowing down TCP. This could have been a load of nonsense,
hence my suggestion UDP be looked into - in case that article did have
relevence.

>quad,

Yes, but note what Peter stated: it is simply a 32 bit value - nothing
more. The implication of this is that provided the 32 bit value is
preserved it does not matter how it is physically stored. It just
happens to be this way for us. An Intel machine will no doubt subject
it to byte and word swapping.

>or would i just have to add the parts together?

Nope. No need to do anything with it, except preserve the value out of
the resolver and hand it to the functions which require it.

>> I dunno if TCP_open blocks or not (it has different modes) but it

>> be closed until the game finished.
>
>So you mean that i wouldn't have to call TCP_open everytime i want to
>send something, i would only have to do it once and then the 'channel'
>would stay open?

Yes.

Both ends of the socket stay open until one of the ends decides to
close (TCP_close) it. Typically this will mean "end of game" ...

... but as you can never tell if the other end is still there then
some sort of code has to be in place to handle timeouts. The most
basic response in this case is to close the connection yourself,
perhaps prompting the user periodically (wait/close).

More elaborate code might allow a connection to be re-established and
continued but such a feature would serve no useful purpose here! ;-)

>Can i have several connections open at once?

Yes. Sometimes this is desirable or even necessary. The protocol
assigned to a socket dictates the range of options for software
connecting to it. There are features that must be supported and
(possibly) some that are optional.

You'll either be connecting to a socket which is reserved for 3rd
party use, or to one which is unassigned. Therefore, you'll be
defining the protocol and can do what you like. :-)

Btw, it'd be a good idea to have the default socket number in the user
options rather than hard coding it into the program.

>> TCP_open establishes a connection to a "socket". There are various

There is an RFC specifically dedicated to sockets. It explains which
socket numbers are used by which protocols. It'll also say which are
unused. Try and locate a site with RFC docs on it and do a search for
"socket" or "socket number"(s).

>> When you're done you'd use TCP_close to disconnect

>there are no more blocks for me to read?

Hmm, I'm not exactly sure what you're asking above.

It returns how many bytes are 'waiting' for you - that is the number
of bytes you can get out of STiNG at the current time. The value

itself is otherwise meaningless to STiNG. It is your responsibility to
decide if it has meaning or not.

Very trivial example (but see further below):
If you'd decided to send data in packets of 10 bytes then obviously
you'd be using doing something like this:

```
LOOP
if (Cnbyte_count >= 10)
Read 10 bytes -> packet
Process packet
endif
ENDLOOP
```

On the other hand, you might simply transmit data as text, in which
case you'd be looking for a carriage return:

```
LOOP
if (CNbyte_count >= 1)
Read & Append 1 byte -> buffer
if (byte equal(CARRIAGE_RETURN))
Process buffer
endif
endif
ENDLOOP
```

>Does CNget_NDB return the address to the string?

eek! I can't remember what that function does I'm afraid! All I've got
is the C header file. :-(

Looking at that, whatever it is CNget_NDB() does, it takes a 16 bit
argument and returns a pointer to a datatype called 'NDB' from which I
can guess at its purpose. That isn't very useful however!

>> CNbyte_count() returns negative if there's an error, the number of

>> immediately.
>
>And how do I get the address from which I should read the data? (already
>asked this earlier)

The only function I've used is CNget_char() which simply returns the
next byte waiting. Easy but probably not very efficient. When somebody
else answers, I'll be reading as well. :-)

Rather a lot!

>LCGSNB.LIB
>LCMSNB.LIB
>LCSNB.LIB

> If no one has a solution to this, does anyone out there use makefiles
>with Lattice?

I dunno how capable the Lattice make is but with MWC I split up
sources into subdirectories grouped by "subject". Something like this
will serve as an example:

```
SRCLIB--+
|
+--G--+
| |
| +--GEM--+
| | |
| | +--AES--+
| | | |
| | | +--FORM
| | | |
| | | +--SHEL
| | | |
| | | etc
| | |
| | +--VDI
| | |
| | +--MISC
| |
| +--TOS--etc
```

```
|
+--U--+
|
+--STR
|
+--MEM
|
etc
```

I used to simply 'cd' to SRCLIB then 'make'. The SRCLIB makefile just invokes make for G and U. The G makefile invokes make for GEM and TOS and so down through the subdirectories.

Unfortunately my machine only had 1 meg at the time and there came a point where this took too much ram. So I resorted to a batchfile which specificially invokes each make in turn. I've never bothered to change it back since I got more ram.

>Specifically, I need a makefile that will recursively
>do makes.
>
>I can do it with gcc/make, but I'm not quite sure about lc.ttp
>and clink.ttp with make.

I dunno the capabilites of the lattice linker but with MWC if you put a load of stuff into an object file then reference something in it, all the other stuff in the object file gets pulled in as well.

The following is the makefile for my CPU folder ...

```
CFLAGS =-A

NAM =_cp_cpu
OBJ =_cp_peek.o _cp_poke.o _cp_sup.o _cp_usr.o _cp_stk.o
_cp_stat.o\
_cp_irq.o _cp_86l.o _cp_86w.o _cp_odda.o _cp_rda6.o
_cp_boot.o\
_cp_cook.o _cp_osh.o

HDR =cpu.h

$(NAM).obj: $(OBJ)
rm -v \inc\$(HDR)
cp -v $(HDR) \inc
ar rs \lib\libu.a $(OBJ)
ld -r -o .\$(NAM).obj $(OBJ)
autodoc $(OBJ)

$(OBJ): $(HDR)
```

It builds the sources, updates the header file, then has the librarian (archiver 'ar' here) put the object file for each source into libu.a thus the MWC linker only pulls in the code referenced, not all the other files in CPU as well! The linker 'ld' then gets invoked. It

gathers all the individual object files into a single object file thus
the dependancy is satisfied.

autodoc can be ignored. For the curious it extracts documentation from
the sources and builds a documentation file.

kbhit? Which compiler is this?

If we're talking about the PC then kbhit() is part of conio.h which
are low level calls whereas stdio.h is high level and very likely
buffered.

If we're talking Atari then I suspect the same. kbhit will probably be
a gemdos or more likely a bios (Bconstat) call and this will not mix
well with stdio either for the same reason.

Btw, I once had a dumb terminal off a mainframe for a few days. I
could get my STFM to send stuff to it which would be displayed fine
but could not get input back from the terminal's keyboard. Bear in
mind I had no info at all on the terminal (and I hadn't had the Atari
long) so anything could have been the cause but for what it's worth,
the STFM did not have HsModem at all.

Usually the path is the same as the program.

Thus:

If you run ...

c:\fred\prog.exe

... then the path is

c:\fred\

ie Dgetdrv(),Dgetpath().

but this is not always true. Multitasking systems allow the user to
change this, and even old Gem versions would not set the path properly
if the user right-clicked on the program (the path would remain set to
the active window).

Gem programs can find out which path they were launched from by
calling shel_read().

Tos programs have to rely on Dgetdrv(),Dgetpath().

Also, programs sometimes use environmental variables like $HOME for
example (to override the above).

Is there any better solution to this, I realize kbhit() might not be the
best. I beleive if I read with getc it will wait for input instead of giving
me EOF of a stream. How do I do?

Nevermind. I now know that there's only one block of data and
CNbyte_count() tells me how big this block is.

I saw that there's a function called CNget_block(), which probably
copies the data received to a buffer which the programmer specifies. It
takes the handle of the TCP-connection, the adress to which you want the
data copied, and how big the buffer is. So it has to work the way I
think, right? Now I've managed to open a TCP-connection, send some data,
and use CNbyte_count() to know how much is available to read. But since
I only have one falcon (or one atari-computer for that matter) I've been
unable to test anything seriously. I tried to connect to my own
IP-address and to send data to it, but I didn't get any data back. Maybe
STiNG doesn't transfer data if the sender has the same IP-address as the
receiver. TCP_send didn't give me an error message though, so it should
have worked.

But for now I don't have any more questions, since I haven't been able
to test transferring data. I only hope that it'll work when I've got

another atari.

Hi!

Guy Harrison <guy@swampdog.demon.co.uk> wrote:
> Gem programs can find out which path they were launched from by
> calling shel_read().

But that also isn't always true. For example, the system shell in
MultiTOS does not get its path this way.

Therefore, I use a different method if shel_read() isn't successful:
shel_find(). It's documented that shel_find() first searches the
program's home directory, even if the current dir is set differently.
So, search for your application's filename and parse the path returned
(because it's often a relative path).

Btw, if you just want to load some support files, you even don't need to
know about the application's path, just use shel_find(). rsrc_load()
internally also uses shel_find().

> Tos programs have to rely on Dgetdrv(),Dgetpath().

No, they should rather check argv[0], if it was set by the shell. But
it's not guaranteed that argv[0] contains a path, and as a TOS program
may have been run from a completely different directory, it's actually
impossible to get the program's path in call circumstances.

You can only be sure about it if argv[0] is set _and_ contains an
absolute path.

Ciao

Thomas

>>buffered.
>
>
>Hmm ... I changed buffering with setvbuf() but no setting helps.

Imo, if ever I have a situation where I need to turn buffering off
then I'm inclined to leave it as it is and approach it the problem at
a lower level. After all, the main reason for disabling buffering is
usually to "see" the behaviour of the operating system. This is
machine dependent so the code might as well use the operating system
i/o calls in the first place. Doing this also has the benefit it
bypasses any inconsistencies that might exist in the compiler's stdio
implementation. Who knows what os calls stdio performs - just because
buffering is disabled does not mean that it couldn't be making os
calls that use their own buffering!

Lastly, there have been reports of Lattice having a 'bug' in its
"filing system" (possibly the reason some folks find Newsie does wierd
stuff to files). No-one has ever stated specifically what this bug is.
It would bother me if I used Lattice!

>>If we're talking Atari then I suspect the same. kbhit will probably be

>I beleive if I read with getc it will wait for input instead of giving
>me EOF of a stream.

Yes, it will wait for input. It can also return EOF! ;-)

>How do I do?

I'd code for Bconin/Bconout directly and locate the problem. Something
like this at both ends ...

[I made this up just now btw] :-)

```
Test()
{char *op ="Hello?";
int16 ch;

/* loop until "Hello?" sent */
for (;*op;) {
/* ?char waiting? */
if (Bconstat(BC_AUX)) {/* yes*/
/* fetch and dump on screen */
ch = Bconin(BC_AUX);
Bconout(BC_CON,ch);
}
/* try and send another char then ... */

/* ?we done sending? */
if (*op) {/* no */
/* pause until stream ready */
while (!Bcostat(BC_AUX)) ;
/* send next char */
Bconout(BC_AUX,(int16)*op);
op++;
}
}
}
```

In *theory* running the above on both machines should allow each end
to receive chars and transmit them at the same time. If it doesn't
work then:

a)
My code is faulty.

b)
The problem lies in the operating system. Is the serial port
configured properly and is there anything about 'Bcon' that we don't

know - Bconmap springs to mind for instance.

If you are successful please let me know. By strange co-incidence I may need to be doing exactly the same thing myself between a PC and an STE. I've finally managed to dump the PC's internal modem and now have the com ports working again. All I need now is some space to set up the Atari - Yippee! <g>

Methinks you'll have to mess with the STiNG settings/routing. The term
"loopback adaptor" comes to mind. This is address 127.0.0.1 iirc and
may be part of what needs sorting to have data sent reappear back
where it started ... but I really am talking about stuff I know
nothing about!

The big majority of the people using their Atari have a hard drive.
But that's not the point. Caching file systems can be used with floppies
too, if used, they leave the floppy corrupted upon RESET.

It's also not restricted to file systems. Most more sophisticated systems
require some shutdown action in order to gracefully switch off. A RESET
is not an option on such machines.

This is irrelevant if the RESET is triggered by a game that takes the entire
machine anyway, kicking out everything else. I know that you're only concerned
with such stuff.

>>is, if things go bad, not recoverable. I would never, ever let any exe-

>>
>>It's useless, as after the RESET it will succeed doing it.
>
> Hello ?????... wakey wakey Peter ?...if you tampered with a file and
> it reset your luverly hd. would you tamper with it again?... DOH!

The virus, which you cited here, - unless it wasn't a dumbhead who did it - will of course install itself in one of the two regions in memory that TOS will automatically restart. This means, a RESET is useless, the virus will be restarted and succeed to tamper with your files, corrupt your system.

If you didn't know that this is possible with TOS, then it's time that YOU wake up, Tony. After all, the possibility is known since 1986 or so.

Again, this is heavily besides the point. If you find a virus, you're free to hit the RESET button. The subject of this thread deals with programmed RESET. How should that help fighting "programs tampering with files" ? Any idea ?

Cheers Peter

> a personal usage.

Looks like an interesting concept. I think you got the main basics from other postings here. This is what I'd say.

For both, warm and cold, raise the CPU interrupt flags to 7. Move the system stack to a save area (for the following paragraph).

For a cold boot, do the following now : Clear the reset system variables as suggested in parallel postings. Clear the two memory pages that makes programs survive RESET. For safety, I'd erase the entire system variables area. Execute an assembler "RESET" statement to reset hardware (not all TOS versions do that on their own IIRC).

Now for both again, jump across the vector to be found in address 4 (The first eight bytes of the address space are copies of the first bytes of ROM). This is the address too that the CPU reads into the program counter upon RESET. That's all.

You won't have any chance to do a good reset "function" in C. You cannot raise CPU interrupt flags, nor execute "RESET" from C, so you must use assembly language for this.

> the 'expense' of TCP?

I'm not sure what you mean here. UDP and TCP are treated exactly indentically
by the network layer (IP), so delays that a packet of one type experiences
would be the same as if the packet were the other type.

> ie I read some news article somewhere, where someone was moaning that
> UDP was slowing down TCP. This could have been a load of nonsense,

I think it is. There is no interaction between UDP and TCP, apart from
each one taking bandwidth for delivering the packet which naturally is
not usable for the other protocol.

It could be meant on an implementation level though. TCP is pretty
sophisticated in that it achieves it's goals with little network traffic.
If a reliable data stream concept (i.e. avoid dupes and loss etc.) were
to be build with UDP, it's easy to waste bandwidth doing it in a less
than optimal way. This bandwidth again is not available for TCP, possibly
that was meant by that publication.

That's one way. There is a more flexible way, both are described in detail
in the programming docs. Read the pages on TCP_open in STING.HYP (needs
ST-Guide to view it).

> the slave or the master exits.

Generally, the best solution for the master is keeping always one socket in
LISTEN state, i.e. waiting for a slave to connect to it.

This means TCP_open'ing it, and continually observing it whether it becomes
connected. When it becomes, it is added to some server internal list of
open connections to deal with, and another TCP_open is done to have a new
socket LISTENing.

The latter is certainly a good idea, regarding the master TCP port number.

On the slave's side the master's port number must be specified, so a good
default value which can be edited is a good idea.

If the more flexible TCP_open is used, the local port number must be specified
too. Observe the TCP_open return code, it will tell if any conflicts arise !
Needless to say, this should be done in any case.

You're rather free to choose the port number, just the numbers from 0 to 1023
must be avoided. They are the so-called well-known ports which have a meaning
assigned to them. Port 80 for instance is reserved for WWW, Mario posted some
more :

>: then have to call CNbyte_count several times until it tells me that
>: there are no more blocks for me to read?

There is no way even the sending side TCP can know how many data the application
will pass to it for delivering to the remote. So how can the remote know how
many data is about to come ? ;-)

CNbyte_count returns the number of bytes that can be read from TCP *immediately*
without having any further data arrive from the network. Obviously this is data
that already *has* arrived, and is stored locally. It is limited by the receive
window, so if you have a receive window of, say, 8192 bytes, CNbyte_count will
never return a number larger than that one.

Not sure what you mean here. CNbyte_count does not deliver data. You'll need
to do another call to actually read it (by the application). You can read
single bytes by CNget_char, or big blocks by CNget_block or CNget_NDB. Read
the docs in STING.HYP

Yep, using the same machine is faster than even Ethernet, no way to introduce
trouble configuring a real network, and you do not need to change seats all
the time to move to the other machine. Will need multitasking (MagiC or MiNT)
though, whereas single-TOS is enough for a two machines test setup.

You haven't read the programming docs. CNget_NDB is a very efficient way to
receive data, it must be handled with a little care though. The latter means
that, after it has been called, and returned data (not a NULL) indicated by
a real pointer (to a NDB), it cannot simply be left alone. After the data
has been processed, the application is responsible for properly releasing
the NDB, if it doesn't do that, STinG will run out of internal memory even-
tually. See STING.HYP for example code how to do that (it's easy, but must
not be forgotten).

>>> CNbyte_count() returns negative if there's an error, the number of

Exactly. It's the reason why MGftp is so exorbitantly slow reading directory
contents. It does so using CNget_char ...

> think, right?

Right. Note this function has a quirk that is actually a relic from STiK,
which I cannot change without breaking STiK compatibility. It won't copy
any data (return an error) if the block is specified to be bigger that
the amount of data arriving. For instance assume CNbyte_count has returned
1011 bytes are ready to be read. Calling

```
CNget_block (handle, buffer_ptr, 1024);
```

will lead to an error (no data copied) since the buffer is 1024 bytes large
but there are only 1011 bytes to be copied. It's safe to do the following
though :

```
number = CNbyte_count (handle);
error = CNget_block (handle, buffer_ptr, (number > 1024) ? 1024 : number);
if (error < 0) {
/* error handling */
}
```

Have you activated STinG (STING.CPX, "STinG Internals") ?

2307. new web site

Newsgroup: comp.sys.atari.programmer
Date: 1998-09-13 00:00:00 UTC
From: centek <vxp@imaginet.fr>
Message-ID: <6thdpb$ms5$2@news.imaginet.fr>
Source record: 3722

Dear Madam, Dear Sir,

After technical problems, we are pleasured to announce you the OFFICIAL
OPENING of our NEW WEB SITE.

www.centek.fr

If you have already visited our site, we propose you to come again.

Except the technical problems we have corrected (NETSCAPE is now running !),
some new informations about the CENTurbo II are available:
- new benchs of the CT2 versus the TT030 and the ST wich will allow you to
realize the difference between the CT2 and your computer or the new
machines...
- hardware informations for the hardware and software designers and the others,
especially a very simple 'block diagram' to understand what the extraordinary
power the CT2 brings to the Falcon !

News PHENIX informations will nextly be available, but we want to confirm you
that the number of PCI slots is THREE, not TWO ! The new file 1.3 corrects this
error.

Don't forget to have a look on the 'NEWS' about the DSP 56301 card and the new
management of the IDE HDD by the CT2...and on the new software 'V-TRAX'.

ATTENTION
Caused by an external technical problem, our e-mail centek@graphity.fr stopped
to run correctly the 10th July.
If you have wrote us after this date, please send us again your mail at
vxp@imaginet.fr
We will answer you as soon as possible...

Yours Sincerely

CNget_NDB is about the best call available if you are writting your own communications spec.

An NDB is a Network Descriptor Block.

CNget_NDB get's the next one on the queue for the connection.

What is a Network Descriptor Block you ask?

Basically a TCPIP packet with all the low level headers ripped off.

So you can format your own packet, with your own headers. And this call will grab the packet and strip it back down to the same state it was sent in.

Completely halfassed made up example to illustrate the idea.

You want to send a message via a server to another player on the server. So we'll have this great fictitious header setup.

0x80 (Send a message for me)
joe blobb (recipient)
I'm going to kill you sucka (the message, maybe topped off with a dual use of \r\n)

When the server get's this NDB they will see it the same way
So they can just parse the lines and act on them.

It really does save alot of overhead and trafic on the network if done properly.

Hope this helped.

Dan
aka baldrick@netset.com

Hi!

Peter Rottengatter <perot@arisia.stud.uni-hannover.de> wrote:
> Clear the two memory pages that makes programs
> survive RESET.

If you're referring to $600 - $800, I wouldn't advise that. Falcons and TTs store their PMMU tree at $700, so overwriting it will cause a nice crash.

Also note that one machines with PMMU, you can't actually be sure a cold boot will be one. For example, a virus could have installed a PMMU tree which moves away logical $0 to some other physical memory adress, so that neither overwriting all system variables including memvalids, nor reading the reset vector from $0 will do the right thing.

Of course, you could also try to switch off the PMMU on affected processors before performing the reset, but AFAIR this will also cause a crash - at least on the Falcon - even with interrupts turned off.

So, a really safe cold boot will only be physically switching power off for at least 10 seconds, then turn it back on.

Ciao

Thomas

Make sure you disable interrupts around the access to the sound chip.
Otherwise the floppy VBL interrupt might interfere, which wants to access
the sound chip as well.

>
> Have you activated STinG (STING.CPX, "STinG Internals") ?

Yes, I did that, and also set the IP before activating. My program does
this:

1. Locate 'STiK' cookie
2. Get the address to DRV_LIST
3. Check the magic string
4. Call get_dftab with a pointer to a string 'TRANSPORT_TCPIP'
5. Use the pointer returned from get_dftab to call TCP_open, with
IP=64.64.64.64 (just an example) and port=13014 and outputbuffer=100 (at
least I think obuffer stands for outputbuffer). TCP_open returns a
positive value, which I take as the handle.
6. Call TCP_send with the handle, pointer to the string I want to send,
and how many bytes to send. TCP_send returns positive (or NULL, I can't
remember which)
7. Call CNbyte_count with the handle, but it returns NULL, so somehow
the transfer didn't work out.
8. Call CNget_block (quite pointless, since CNbyte_count didn't work,
but anyway), and then print the received string to the screen. Since

(7.) didn't work no string appears on the screen either.

Maybe there's something in the setup of STiNG that I've missed. Do I have to do something else besides setting IP to 64.64.64.64 and activating? I use the same .TAB file that I use for all other TCP/IP stuff, using HSMODEM 7 and all that, and it works fine.
I tried to do (5.) with STiNG inactive, and it returned an error message, so I can't have messed that up, can I?
Note that (7.) returns NULL, not an error, so doesn't that mean that the actual transfer didn't take place? (and not that the STiK-compatibility 'bug' triggered, since it would have been an error then).
I think I'll try things a bit more now, I 'll report how it all went tomorrow.

Regards
Henrik

btw. I just came to think of something. Maybe my program is too quick att checking if there's some data to read after having sent some. I think I'll wait a second and then try.

No. There is nothing emulated (if it's not a Power Mac at least). These
Macs run Atari software natively, and MagiC is just an application for
MacOS, and the OS for the Atari software. No emulation, but I admit the
classical "clone" term is not very well suited either - still better
than "emulator".

MagiC-PC is a true emulator.

G'day

Thankyou for the welcome! The reason I don't use the ST much nowdays is that I need to use Java and Ada for my course at Uni, so I had to cross over to the dark side (Mac).

Thinking about it though, there is no free or convenient Ada compiler for the Mac. Now, the Ada compiler we use on the PC-contemptibles at Uni run GNAT Ada95 - the GNu Ada Translator. Could this be a case for a gcc-compatible compiler on the ST? Does such a beastie exist?

If it did this could strike a blow against the PC-owning blockheads who thinks that they invented computers! Can anyone suggest a site that would have a gcc for the ST?

I have to admit at this point that I'm not one-eyed - I also have a softish spot for the Mac. Less soft nowdays though, after Microsoft sticking their fingers into the pie...

Cheers

It certainly is the most efficient way. But I'd recommend it only after
the programmer understood completely what the call does.

It does save a lot of internal overhead on the receiving side, but compared
to CNget_block it does not save any traffic overhead. CNget_block is a more
generic way of receiving data, at the expense of slightly more CPU overhead.

Setting the IP alone is not enough, the corresponding port must be active,
otherwise STinG ignores that IP address. I noticed from what you wrote
further on that you did this, but you'd also need to have some connection
there, and a corresponding route. Better use loopback.

> 1. Locate 'STiK' cookie

> 7. Call CNbyte_count with the handle, but it returns NULL, so somehow
> the transfer didn't work out.

Of course it doesn't as there was no machine with the address 64.64.64.64.
But if CNbyte_count returns zero, it merely means no data has been received
yet. It's not an error condition. TCP_open cannot return positive values,
it probably was zero.

For connecting to clients or servers on the same machine, you must specify
a local IP address, or a loopback address. Loopback addresses are those
of the form 127.x.y.z

So do the following :

Have one program (server) do a passive (!) TCP_open by doing

TCP_open (0, 13014);

Start this program. It will listen on port 13014, waiting for connections.

Now do in another program (client)

TCP_open (0x7f000001ul, 13014);

and start it parallel to the first one. Note 0x7f000001ul == 127.0.0.1.
The second causes TCP to actively open a connection to the "owner" of the
port 13014, which is the first program (the server). If the server monitors
the connection state while waiting, it will notice that the state changes
from TLISTEN to TESTABLISH at the precise moment the client did the TCP_open.

Now the two programs can exchange data using the TCP_send and the CN* calls
in a symmetrical network situation. You can have the two programs run on
different machines by using the server machine's IP address in the client's
TCP_open.

> Maybe there's something in the setup of STiNG that I've missed. Do I
> have to do something else besides setting IP to 64.64.64.64 and
> activating? I use the same .TAB file that I use for all other TCP/IP

ROUTE.TAB must have a line saying

0.0.0.0 0.0.0.0 <name of port you activated> 0.0.0.0

> Note that (7.) returns NULL, not an error, so doesn't that mean that the
> actual transfer didn't take place?

TCP_open does not cause any transfer in the sense to be reported by
CNbyte_count. CNbyte_count only reports user bytes.

> (and not that the STiK-compatibility
> 'bug' triggered, since it would have been an error then).

What the hell is that ???

> btw. I just came to think of something. Maybe my program is too quick
> att checking if there's some data to read after having sent some. I
> think I'll wait a second and then try.

That's possible. There will be a few milliseconds before the data appears
to get received.

Cheers Peter

> is wrong, and I really don't understand why.
>

Here's a small devpac source I use.

```
YmRegs=$FFFF8800
YmDataIn=$FFFF8800
YnDataOut=$FFFF8802

write_prn: macro
move.b #15,YmRegs.w
move.b \1,YmDataOut.w
endm

read_prn: macro
move.b #15,YmRegs.w
move.b YmDataIn.w,\1
endm

usage:
write_prn #123

read_prn d1
```

If there's still problems, your cable is perhaps too long / not shield (is the error always on the same bit ?). So you'll have to send your datas in packets with a checksum and the reciever acknowledge each packet after testing it.

hope this helps

salut
Eric

2325. Horloge externe pour Falcon

Newsgroup: comp.sys.atari.programmer
Date: 1998-09-16 00:00:00 UTC
From: Softjee <softjee@wanadoo.fr>
Message-ID: <35FFF4CF.FB1DDC10@wanadoo.fr>
Source record: 3740

Bonjour ï¿½ tous,

Une petite info pour vous annoncer que nous reprennons la production
d'une holorge externe pour Falcon. La NEWCLOCK (original non ?) est donc
une
horloge externe compatible B-CLOCK dï¿½livrant donc 2 frï¿½quences : 44,1
Khz et
48 khz programmable par soft. Le boitier de taille 44x40x16 se connecte
ï¿½ la
sortie DSP et possï¿½de une LED indiquant dans quelle frï¿½quence se trouve
l'horloge.

Le prix est toujours le mï¿½me : 340 F !

Voila pour cette news !

>>
>I tried to disable all interrupts (XBIOS(26,0..15) and it's still wrong.

That's because the VBL isn't accessible via XBIOS(). What you'd need is
something like this:

read_byte link a6,#-4
clr.l -(sp)
move #$20,-(sp)
trap #1 ; go into supervisor mode
addq.l #6,sp
move.l d0,-(sp) ; store old supervisor stack for restoration
move sr,-4(a6) ; store status register for restoration
or #$700,sr ; disable all interupts
move.b #15,$ffff8800.w ; NB the $xx.w may not work with 32 bit
move.b $ffff8800.w,d0 ; memory addressing.
move d0,-2(a6) ; store value
move -4(a6),sr ; restore status register
move #$20,-(sp)
trap #1 ; back to user mode
addq.l #6,sp
move -2(a6),d0
```

```
unlk a6
rts
```

What this does it to go into supervisor mode and disables all the interupts, reads the input, enables the interupts and then goes back to user mode. This prevents the values being modified in between selecting the register and getting the input. This will make it quite a bit slower, because of swapping between suvervisor and user modes, so if you know how much you're wanting to read beforehand, it would be better to use something like:

```
read_bytes link a6,#-4
clr.l -(sp)
move #$20,-(sp)
trap #1
addq.l #6,sp
move.l d0,-(sp)
move sr,-4(a6)
or #$700,sr
move 8(a6),d1 ; number of bytes to read
subq #1,d0
move 10(a6),a0 ; buffer to store them
.loop
move.b #15,$ffff8800.w
move.b $ffff8800.w,(a0)+
;
; at this point you'll want to add some form of delay.
;
dbra d0,.loop ; jump back to .loop until d0=-1
move d0,-2(a6)
move -4(a6),sr
move #$20,-(sp)
trap #1 ; back to user mode
addq.l #6,sp
move -2(a6),d0
unlk a6
rts
```

call this routine with:

```
move.l #buffer,-(sp) ; buffer to store the bytes.
move #count,-(sp) ; number of bytes to read
jsr read_bytes ; or bsr read_bytes
addq.l #6,sp ; correct stack
```

The reason for adding a delay is to give time for data to be read from the parallel port and put into the YM-2149 register for you to read.

Oh no ! Use

move.w sr, d0
or.w #$0700, sr

to disable interrupts prior to accessing the sound chip, then

move.w d0, sr

afterwards.

Cheers Peter

Have been digging through my old ST stuff in hopes
of possibly using it for some special projects and
came across my copies (legal) of Megamax Laser
C and Debugger.

What ever happened to this company?

Were there any updates?

Does anyone still use these tools?

Thanks,
Mike (n4cnw <at> mindspring <dot> com)

You send/receive with 2 computers (perhaps Atari) or with an
external hardware ?

> move.b #15,($FF8800)
> move.b ($FF8800),D0

This is not enough to read data! You must use a minimum of
handshaking (with ack and strobe). By the way you can write
move.b #15,$ffff8800.w : it's faster and byteless.

> It works, but, sometimes (about once out 2000) the returned value
>is wrong, and I really don't understand why.

You don't to search to the interrupt: they can destroy data but
you must select and write in Yamaha register in IPL 7 !!!

Sacha Hnatiuk (I write the bios functions for Dolmen, so...)

> from TLISTEN to TESTABLISH at the precise moment the client did the TCP_open.

Yes I've done almost exactly what you propose. I have made one program
that opens a passive connection as you say, and then it waits for the
remote host IP in the CAB structure to change to something other than
NULL. It checks this every 25ms. When it detects an IP, the program
prints it as 48.0.0.140. The state you're talking about, is it the last
word to be found in the CIB structure? Maybe it's better to check the
state than the remote IP.

Then I start the 'active' program, that opens a connection to 127.0.0.1
and sends a small string. When the connection is established, the
passive program reacts, but it never gets any data, even though the
active program reports success when sending.

> ROUTE.TAB must have a line saying
>
> 0.0.0.0 0.0.0.0 <name of port you activated> 0.0.0.0

Yes I have it that way.

> > (and not that the STiK-compatibility
> > 'bug' triggered, since it would have been an error then).
>

> What the hell is that ???

Nevermind. But shouldn't the transfer be quite quick, since it's done on the same machine?

Regards
Henrik

Gee, it would help wouldn't if the site was actually in *English*. Not that I'm discouraging people from keeping the old systems alive just because they don't do it in English, but it seem a bit inappropriate to be posting the URL of a non-english website to a predominately english speaking newsgroup, since most of us won't be able to understand it. ;-)

Hmm, double darn! I've had rsrc_load() fail on me in the past. No idea
why at the time though - it was years ago I wrote my own Rsrc_Load()
to fix it by having it go through PATH if the initial rsrc_load()
failed.

>> Tos programs have to rely on Dgetdrv(),Dgetpath().

>No, they should rather check argv[0], if it was set by the shell.

Unfortunately docs on that are vague also. You may only get the
program name.

>But
>it's not guaranteed that argv[0] contains a path,

or anything at all!

>and as a TOS program
>may have been run from a completely different directory, it's actually
>impossible to get the program's path in call circumstances.

Agreed.

>You can only be sure about it if argv[0] is set _and_ contains an
>absolute path.

Also agreed.

Hey that reminded me about this. It's yonks old and was never tested.
Question is folks: would it work? Wierd MWC assembler syntax again of
course!

```
.globl _cp_irq_

.shri

_cp_irq_:
//*[ uint cp_irq(andv,xorv)
/ uint andv;
/ uint xorv;
/
/ the processor interrupt mask is read, then ANDed with andv, then
XORed with
/ xorv and then written back to the interrupt mask. This enables it to
be read
/ or written in any manner. The interrupt mask which was written back
is
/ returned to the caller. For the 68000 the interrupt mask is 3 bits
and is a
/ value in the range 0 to 7.
/
/ _cp_irq() can be called from user or super state. It sets IPL to 7
while it
/ builds the new status register and shifts straight from level seven
to the
/ level required by the caller once it has done so. This does not
imply that
/ interrupts cannot occur during this call, simply that if one does,
the status
/ register contents, as opposed to condition code register, will
either be in
/ the original or required state (not partially built).
/]*/
link a6,$-2 /flag for proc state
jsr _cp_stat_ /test current state
move.w d0,-2(a6) /save state
bne SuperObtained /already super state
```

```
jsr _cp_sup_ /obtain super state
SuperObtained:
move.w sr,d0
ori.w $0x0700,sr /only NMI allowed
lsr.w $8,d0 /move irq mask to match input
mask
and.w 8(a6),d0 /irq mask AND andv
move.w 10(a6),d1 /xorv
eor.w d1,d0 /irq mask XOR xorv
andi.w $7,d0 /ignore unwanted bits
move.w d0,-(sp) /return value to caller
lsl.w $8,d0 /shift new mask to match sr
irq bits
ori.w $0xf8ff,d0 /build rest of sr
move.w sr,d1 /NMI only irq mask
and.w d0,d1 /required mask
move.w d1,sr /shift from NMI only to
required mask
tst.w -2(a6) /old proc state
bne KeepState /stay in super state
jsr _cp_usr_ /back to user state
KeepState:
move.w (sp)+,d0 /mask written to caller
unlk a6
rts
```

And I guess this doesn't qualify as a good reset function does it:

```
Reset()
{uint16 x =0x4e70;
void (*fcp)()=&x;

(*fcp)();
}
```

Hmm, forgot the RTS!

Oh, and just what is that compiler switch that forces a local variable
to be placed in the TEXT segment? :-))

2339. GFA/GEM problem

Newsgroup: comp.sys.atari.programmer
Date: 1998-09-19 00:00:00 UTC
From: Ben Hall <cb170@city.ac.uk>
Message-ID: <Pine.GSO.3.95q.980919204452.8435A-100000@paddington>
Source record: 3654

Hi guys,

I trying to solve a long-standing problem I have relating the text cursor, specifically with OBJC_EDIT.

I'm using a heavily-modified version of Flydials, and I've noticed this behaviour in other GFA Flydial-dependant programs (for example, Ergo!pro has this bug), and it's a right pain!

Basically, I have a window with an editable text object in, and the text cursor is enabled. In general, the cursor is turned off and on with:

```
~OBJC_EDIT(rsc_adr%,edit_obj&,key&,idx&,3,idx&) !Turn cursor OFF
~OBJC_EDIT(rsc_adr%,edit_obj&,key&,idx&,1,idx&) !Turn cursor ON
```

But, if another window is moved over the cursor, GEM won't redraw it as part of the normal window redraws, so the cursor disappears. On switching back to my application, I need to be able to properly redraw the cursor. Now GEM or GFA seems to be drawing in a kind of XOR mode, so if the cursor is turned on and redrawn when the cursor hasn't been erased by the window, the cursor will then disappear, only to reappear when the cursor position is moved and giving redraw errors. So, I know this is kind of difficult to explain, but what I need to know is an accurate way of turning off and on the cursor, and redrawing it. CoNnect, as an example does this properly - when switching back to a CoNnect window, the cursor is turned off and then properly back on, which is exactly what I need to do. Any ideas..?

Thanks!

I do not really understand this, partially because information is missing
(like the AND and XOR masks), but to me, "written back to the interrupt
mask" and "can be called from user ... state" is a contradiction.

What's the goal of this bit ?

No, the TCP state is not directly accessible in public versions of STinG.
You can wait for a specific TCP state using TCP_wait_state(), or just
call CNbyte_count() it'll return ELISTEN until the connection becomes
established. The latter is the usually used method.

> Then I start the 'active' program, that opens a connection to 127.0.0.1
> and sends a small string. When the connection is established, the
> passive program reacts, but it never gets any data, even though the
> active program reports success when sending.

There must be a bug in your code checking for data. Try a version that
collects data using CNget_char(), at least that should work alright.

> Nevermind. But shouldn't the transfer be quite quick, since it's done on
> the same machine?

Yes, it should. Depending on what you configured as delay, data should
arrive in a time as short as 10 ms.

Greetings atarians!

I'll repeat myself and ask a question I've asked before, with a little
extension:

>Is it possible to write the image contents of an object tree to memory
>(without viewing it on screen first), or do I have to draw the object on
>screen, and then save the screen contents to memory??

When I asked this I got the answer 'no', from (I think) Jo Even Skarstein.

Now I've read somewhere on the WWW that it is possible to use something
called 'sceen swapping routines' to redirect the output to a dedicated place
in memory instead of the physical screen adress.

Could this be used to do what I asked for? Anyone?

Thanks in advance,

Joakim

This sort of thing is a pain unless you have *full* control of the cursor.
I suspect that programs that handle this correctly are managing their own
cursor draws. I know that in my programming I have a standard bitblit
procedure which I then use to "create" blinking or steady cursors at will.
Since I am in control, I can effect redraws as required, e.g. as part of
the normal redraw process.

Hmm, I did find a bug, but it had only something to do with the printing
of the remote IP in the passive program. It now prints 127.0.0.1 and not
48.0.0.140.

But I think CNget_block is so simple, I can't figure out what's wrong.
Okey, I'll test CNget_char , but isn't that one quite slow, since it
only gives me one byte at a time? I heard that CNget_NDB is the fastest
way, but forces me to KRfree the block(s) also.

See ya
Henrik

Hi!

Joakim Hï¿½gberg <fiolerna@al_ALBATROSS_gonet.se> wrote:
> -Is it possible to specify the WORKarea of the GEM-window with wind_set?

Not directly. But you can use wind_calc(WC_BORDER, ...) to calculate the
position and size of a window with a given workarea, which you then use
with wind_set().

Ciao

Thomas

The programmer does have complete control over the cursor, by calling objc_edit
with the proper function codes. I know the documentation of this function is
not very good, but is does work.

From memory : ED_INIT shows the cursor, ED_END removes it. ED_INIT can be used
in redraw code too.

No. You need to call wind_calc first to calculate the total area from the
working area, then call wind_set to set the calculated total area.

Well, now I've found the bug, and of course it was one of the most
simple things possible. I'd calculated the wrong offset for CNget_block,
I thought it was 72bytes from the start of TPL but when I calculated it
again I got 76. So I've been calling CNkick all the time. No wonder it
didn't work. :-P
But now it all works perfectly, and the multiplayer option seems
possible after all. Thank you very much for your help, Guy and Peter and
everyone else!

2357. Bad RAM? Or programming error?

Newsgroup: comp.sys.atari.programmer
Date: 1998-09-23 00:00:00 UTC
From: gmiller@inca.co.nz
Message-ID: <6u9s45$m17$1@newshost.comnet.co.nz>
Source record: 3672

While testing a system-level utility I am writing, my TT crashes/hangs.

The code where it crashes looks like this:

```
move.w #%01,-(sp) ; TTRAM only
move.l #(4<<20)+65536,-(sp) ; 4 MB + 64k
move.w #m_xalloc,-(sp) ; Malloc with pref
trap #1 ; call gemdos
add.l #2+4+2,sp ; fix stack
tst.l d0 ; null = fail
beq fail
tst.w d0 ; aligned on 64k boundary?
beq aligned ; yes, so no need to realign it
add.l #$10000,d0 ; increment pointer
eor.w d0,d0 ; zero low 16 bits
aligned ; D0 is usually around $01200000
move.l d0,a0 ; a0 = pointer
move.l #((4<<20)>>2)-1,-(sp) ; split d0 into d0/d1
movem.w (sp)+,d0/d1 ; d0/d1 now have high/low words of counter

tol ; top of loop
clr.l (a0)+ ; IT CRASHES HERE when A0 > $01400000
dbf d1,tol ; clear 64k
dbf d0,tol ; multiples of 64k
```

Everything seems to be OK until A0 reaches $014xxxxxx.

Shortly after this, the TT hangs badly - which it should not do, as I have 16 megs of TT RAM, so the end of RAM would be $02000000 - a good 12 megs beyond where it crashes.

However, debugging reveals that memory at $01400000 is a direct copy of $01000000. Likewise $01800000. And $01C00000.

I took the top off the TT and checked the RAM was properly inserted and the memory board was properly pushed into the fast ram slot of the TT.

But the problem still occurrs.

Do I have bad RAM, or is it something else?

--

I wouldn't call that a full control. You can't e.g. set the clipping
rectangle at all with objc_edit().

Given that your external window size and work area are related depending
on which window widgets you have active, yes. You convert the required
internal work area size to window external x y w h using wind_calc, and
then set the window size using these values. Using wind_calc the other
way, you can figure out the effective work area from a given window size.

The latter. Note that TT RAM starts at $01000000 (16M).

>
> But it does work to check the remote IP, right?

It should.

> But I think CNget_block is so simple, I can't figure out what's wrong.

CNget_block has a pitfall : It does not return any data if the buffer you
want it to fill in is larger than the amount of data that has arrived. So
youï¿½ll never receive any data if you try

CNget_block (handle, buffer, 1024);

but your sending client only ever sends 1000 bytes. Only 1000 bytes will
ever arrive, so the buffer, being 1024 bytes large, cannot be filled in
completely.

I know this is stupid, but it was decided this way by Steve Adam when he
created STiK, and I cannot change it without breaking compatibility.

> Okey, I'll test CNget_char , but isn't that one quite slow, since it
> only gives me one byte at a time? I heard that CNget_NDB is the fastest

Yes.

According to the Atari docs I have, TT RAM space ends at $013FFFFF and
memory from $01400000 to FE000000 is reserved. Why do you need to go into
this space?

See my website for "The Atari A to Z" book shareware ASCII files. There is an
extensive memory map in that.

2367. assembler code for string matching required

Newsgroup: comp.sys.atari.programmer
Date: 1998-09-26 00:00:00 UTC
From: gary@the-gap.demon.co.uk
Message-ID: <360d111c21ab550@the-gap.demon.co.uk>
Source record: 3682

Hi guys

I've been struggling to convert some C code (taken from NOS) that does a
wildcard matching of two strings; one string and a pattern.
The pattern should be able to contain wildcards such as *, ? etc.
I'm struggling with how to code it so that the following match is detected:

string = alt.fred.rec.pets.gary
pattern = *.rec.pets.*

The above example should match, but I just can't get my head around the
required code :(Trailing stars are obviuosly easy, but it is the leading
star, followed by actual data..... bit that is causing me headaches.

Does anyone have an assembler routine that does this? I'm not that good with
C and really would like an assembler routine.

Thanks for any help,
Gary

> this space?

Well, my 18 meg TT (16 Meg TT RAM, 2 Meg ST RAM) definitely has memory
in the range $1000000 - $1ffffff. Perhaps Atari originally designed a
TT RAM expansion board which could only handle 4 Megs, and made a 16-Meg
capable one later?

To the original poster: If your RAM isn't unique from $1000000 - $1ffffff,
you don't have 16 Megs of functional RAM. (This I should know, I'm working
with malfunctioning RAM at work right now, and I have been dreaming in
hex lately 8^)

If you do really have 16 megs of TT RAM, perhaps the jumpers are just
set wrong on the expansion board.

2370. PalmPilot programming with Atari

Newsgroup: comp.sys.atari.programmer
Date: 1998-09-28 00:00:00 UTC
From: Russell Magee <bigruss@cheetah.spots.ab.ca>
Message-ID: <6una4u$6qu$4@f02s02.tac.net>
Source record: 3685

Hi all,

I've been working on some tools to let me build PalmPilot applications
using my Atari. Basically they take a .PRG or .TOS file and convert it to
a PalmOS .PRC file which can then be HotSynced (not on Atari yet --
you need a PC, Mac or Linux to do this right now) and run.

(Anyone working on Hotsync software that will run under single-TOS?)

(For those who don't know, the 3Com PalmPilot is a handheld organizer that
uses a Motorola DragonBall CPU -- basically a 68k with extra stuff).

Current support is only for assembler programs (Devpak) and single-pass
assembly (no linking), due to the memory model of PalmOS programs.

I posted this here due to the fact that only Atari-heads would be
possibly interested in this.. is there anyone else out there trying to
program their PalmPilots without using Wintel hardware? Once I fix some
more really bad bugs and clean things up I can post them to my web site
if anyone's interested.

-Russ

I've try to port Pilot GCC under MiNt but for the momment it doesn't work.

best regards, Rodolphe.

2372. Re: STiNG-programming

Newsgroup: comp.sys.atari.programmer
Date: 1998-09-28 00:00:00 UTC
From: Gilda Henrik <di98gihe@ios.chalmers.se>
Message-ID: <360F991D.3C26AC7A@ios.chalmers.se>
Source record: 3687

Hi everyone!

Thanks to Peter and Guy, I now have two working programs that sends/receives data using STiNG. One of them is passive, the other active.
I run the passive program first. It initialises a passive connection, and then waits for the active program to open a connection to it (loop-back: 127.0.0.1) and send some data.

It works fine to read the data using CNget_block, but since I'm going to use all this in a game, speed has the highest priority. I have therefore tried to replace the use of CNget_block with CNget_NDB. I read in STING.HYP, that I have to KRfree both the incoming data blocks and the NDB structure associated with each block after having processed them. According to STING.HYP, an NDB consists of a pointer to the base of the block, a pointer to the data of the block, a word saying how many bytes the data is, and a pointer to the next NDB-structure (if there is any).

My passive program waits for the connection from the active program, and then waits for 30 seconds, to give me (the user), enough time to write two small strings of text in the active program and send them to the passive one.
I successfully manage to read the first NDB and its data, but when I try to process the next NDB, the system crashes. Magic reports "systemstapeln ï¿½berlaufen", which I interpret as the system stack having been thrashed in some way.

I use the last pointer (*next) in the first NDB-structure to get the address to the next NDB. Is this correct?

the pseudo code for the NDB-processing is like this:

1. call CNget_NDB with the handle
2. was the returned pointer in d0=0? if yes: quit.

3. use the pointer to get the address to the data of the NDB (*ndata), and how many bytes to read (len).
4. use a small loop to copy the data from the NDB to a buffer, null-terminate the string, and print it.
5. check the last pointer (*next) to see if there is another NDB to process. If zero, goto 7.
6. KRfree both the data pointed to by the NDB (*ndata) and the NDB itself. Goto 3.

7. do the same as 6, except that we don't jump to 3, since the NDB's are finished now.

I'm cautios about not relying on a0-a2 and d0-d2 after having called
KRfree, CNget_NDB or Cconws. Is it correct that the address to the block
that I want to free using KRfree, should be passed on the stack?

Regards
Henrik Gildï¿½

2373. MagiC Programming

Newsgroup: comp.sys.atari.programmer

2374. Atari ST books for sale - Abacus, misc

Newsgroup: comp.sys.atari.programmer
Date: 1998-09-30 00:00:00 UTC
From: bretelle@autonet.net
Message-ID: <36137e2e.513464665@news.provide.net>
Source record: 3689

Getting down to the last of the Atari ST items on my shelves. This group includes many of the ABACUS Atari ST Series from Germany.

These books are especially valuable sources of ST info. They haven't been available for many years, and when they're are gone, the information in them pretty much goes with them.

Priority Mail shipping is $3.00 for one or two, or they can be sent at Book Rate which is a little cheaper (and a lot slooower).

Misc. Atari ST Books - $10 each

Compute's ST Programmer's Guide -

The comprehensive guide to programming the Atari ST personal computer. Includes dozens of example programs, details on how to access advanced features and explanations of BASIC and LOGO. Includes writing GEM applications in "C".

Programmer's Guide to GEM - Sybex

A detailed introduction and reference guide for anyone wishing to develop applications for the GEM operating environment. Programming the VDI for portable graphics software, using the Resource Construction Set, a complete guide to AES functions and lots of programming examples in C.

GFA BASIC Book - MichTron

An intermediate programming tutorial for GFA BASIC, written by Frank Ostrowski, the author of GFA BASIC itself. It's designed for the person with a casual knowledge of BASIC who wants to gain an understanding of the more complicated aspects of the programmers' art. It guides you step by step through many intricate facets of BASIC and GEM programming, using GFA. Comes with a disk containing many of the program examples. This book is especially valuable for the practical insights Frank gives from his years of development on the ST.

ABACUS Software Atari ST books - $10 each

Volume 2 - Atari ST Internals -

The authoritative insider's guide. Chips, MIDI, GEMDOS, Sound, BIOS, Interrupts, Errors, almost everything you need to know about the ST.

Volume 3 - Atari ST GEM Programmer's Reference -

The complete guide to programming the ST using the Graphics Environment Manager. GEM, VDI, AES, GDOS, GIOS, programming,

development, compiling C, inside GEM. Many example programs in C and 68000 assembly language.

Volume 4 - Atari ST Machine Language -

Complete introduction to machine/assembly language on the ST. Logical operations, bit manipulation, program development, 68000 register structures, memory structure, operating system, and more. Many examples and problems with answers.

Volume 5 - Atari ST Tricks & Tips -

Valuable collection of software tools and programming hints. Using GEM from BASIC, adding machine language to BASIC programs, super fast RAM disk, print spooler, starting TOS applications automatically and more. Contains program listings and color plates. A collection of info that didn't quite fit into the other volumes.

Volume 8 - Peeks and Pokes -

Keys to revealing the secrets hidden within your Atari ST. Using the BASIC "Peek" and "Poke" functions to: Customize the desktop, change the mouse shape, change the character set, read the keyboard or joystick, make your own fill patterns, direct disk accessing, system variables, pointers and the CPU stack, setting up the RS-232 interface and a lot more. This book packs a lot of valuable information all in one place.

Volume 9 - Atari ST BASIC Training Guide -

Everyone's introduction to ST BASIC. A very functional, educational and well-written introduction to ST BASIC. From problem analysis to algorithms to BASIC commands. It helps teach programming quickly. Includes quizzes on the concepts introduced to reinforce the learning of programming.

Volume 11 - Atari ST BASIC to C -

Move quickly beyond the BASICS with the powerful C language. Use your knowledge of BASIC to move on to programming in C with the help of this useful guide. Shows comparisons between the familiar concepts of BASIC and the equivalents in C to make moving into this more powerful and versatile programming language very easy. Many, many programming examples.

Volume 12 - Atari ST 3D Graphics Programming -

Concepts and techniques. Learn how to create impressive and fascinating 3D graphics on the ST. Covers the basics, then moves on into more advanced concepts. 2D & 3D transformation, hidden lines and surfaces, data structures, spatial projection, screen manipulation, rotation, light and shadows, and more. Includes many programming examples in 68000 assembly language.

Volume 13 - ST Disk Drives: Inside and Out -

Discover the capabilities of the Atari ST disk drives. A book with in-depth coverage of the concepts and techniques of using floppy disks, hard disks and RAM drives. The book explains in detail the file structures, software, firmware and hardware that support disk functions on the ST. BIOS, DMA, controllers, tracks, sectors, clusters, gaps and FATs. Includes an extensive description and listing for a full-function disk monitor program to help investigate the ST's disks. Lots of info in this one.

I'd just as soon pack all of these into one big (and heavy) box, so make me an offer on all of them, or bundles.

If you're planning on sticking with your ST, or are new to the world of the Atari ST, you need these books!

BobR

There is some kind of VisualAssembler... but for C no. Basic I don't know but
I don't think so. For C++ there is GCC which is also free and one of the
best compilers available. Where to find it, I don't know but most ftp
sites should have it.

2376. Lattice C 5.52 on a Falcon

Newsgroup: comp.sys.atari.programmer
Date: 1998-09-30 00:00:00 UTC
From: Michael Clemmetsen <mc@syn.beetee.co.uk>
Message-ID: <6ut48ffcr1@pheidippides.axion.bt.co.uk>
Source record: 3691

Hello,

I've finally managed to get round to installing Lattice C5.52 on my Falcon so that I can teach myself C, but I've been having problems:

The cascading menus in the Integrated Development Environment (IDE) can not be selected.

This is the case if I use TOS 4.04 or Magic 5.11.

If I use Geneva the menus work. However...

Both Magic and Geneva do not allow me to run the DEMO2 program from within the IDE - well it runs, but then I cannot get back to the IDE after pressing a key. (Yes I have followed the tutorial and corrected the intentional errors so it compiles and links correctly). The Geneva task manager shows that Lattice is asleep and that the child program, i.e. PROG2 is running. It is not possible to terminate either task in Geneva or Magic.

Has anyone got Lattice C 5.52 to run satisfactorily on a Falcon, preferably under Magic? I'm beginning to feel that the only way I will be able to use it is in single-tasking mode under Geneva.

Any information/experience/help much appreciated.

Thank you,

Michael

system stack overflow.

> I use the last pointer (*next) in the first NDB-structure to get the
> address to the next NDB. Is this correct?

Naaaaaah ! ;-)

The entry 'next' is only for internal use of STinG. Didn't I have CNget_NDB()
explizitly write a NULL into that entry before passing it to the application ?
If not, then I should do it. You, as an application programmer, should ignore
it. The next NDB is fetched just like the first one, with CNget_NDB().

> the pseudo code for the NDB-processing is like this:
>
> 1. call CNget_NDB with the handle

> (*ndata), and how many bytes to read (len).

Ok.

> 4. use a small loop to copy the data from the NDB to a buffer,
> null-terminate the string, and print it.

You know this is the sort of action CNget_NDB is intended to avoid, for speed
reasons. What you do here is exactly what does CNget_block() internally. Sure
it's ok for testing, but for efficiency you should do the processing 'in place'
i.e. without copying to a buffer; otherwise the use of CNget_NDB() is pointless.

> 5. check the last pointer (*next) to see if there is another NDB to
> process. If zero, goto 7.

Do not do this. Simply omit this step. There is never 'another NDB' as linked
to this NDB via the 'next' entry.

> 6. KRfree both the data pointed to by the NDB (*ndata) and the NDB
> itself. Goto 3.

This must be done regardless of the 'next' entry. Replace the "Goto 3" by
"Goto 1"

> Is it correct that the address to the block
> that I want to free using KRfree, should be passed on the stack?

Yes. All parameter passing is done one the stack, so that STinG can be
programmed with most languages (very few allow control over which CPU
registers are used for which purpose).

No Visual * stuff ! Visual * is Microsoft, what do you expect ?

There is about a dozen different C compilers, ranging from poor (old ones)
to very nice. There is GNU C++. There are several BASICs, and compilers
for two or three dozen other programming languages.

Hi again,

So does this mean that Lattice 5.60 *does* work with a Falcon or not?

Does anyone know what the major differences are between 5.52 and 5.60?

Thanks,

Michael

Yes, I discovered that shortly after I posted that last article. Is
(*next) always NULL, even if there is another NDB waiting?

> You know this is the sort of action CNget_NDB is intended to avoid, for speed

Yes, as you say, it's just for testing. In the game I will have no use
for printing the blocks, since it's always some kind of message from
another player's computer. I don't mean text messages readable for
humans, but rather messages used for for example position updates and
collision detect and so on.

>
> This must be done regardless of the 'next' entry. Replace the "Goto 3" by
> "Goto 1"

Well, now I've fixed it so it works. Now the pseudo-algorithm is like
this:

1. call CNget_NDB() with the handle
2. if d0=0, then no blocks to read, quit
3. get address to the data (*ndata) and the length (len) by using d0 as
address to the NDB
4. print the data
5. if (*next) is NULL, there are no more NDB's: quit, otherwise goto 1.

Can I rely on (*next) indicating wether there are any more NDB's (but not use it as a pointer), or should I just skip that step and goto 1, directly after 4 without checking (*next)?

2386. 34800 baud ST modem patch?

Newsgroup: comp.sys.atari.programmer
Date: 1998-10-01 00:00:00 UTC
From: Martin-Eric Racine <q-funk@hal.fishpool.com>
Message-ID: <Pine.LNX.3.96.981001155603.21363B-100000@hal.fishpool.com>
Source record: 3602

I remember reading somewhere (HS-modem docs, maybe?) that it is
possible to drive the ST Modem port at 38400 by simply changing
some clocking variables for the MFP (and the baudrate registers
so that this speed is reported as available).

This implies that NO hardware modification is needed.

Does anyone recall reading this and where, or otherwise knows
how to do this? Thanks.

From: codc01@gel.usherb.ca
Message-ID: <6v0c3s$3r7$1@nnrp1.dejanews.com>
Source record: 3603

Greetings,
The first version of the Free Pascal compiler for 680x0 targets is now
available on most Free Pascal official sites. Currently available are:

- Cross development environment for AmigaOS on linux-i386
- Cross compiler for Atari TOS on MS-DOS
- Native AmigaOS Free Pascal compiler

These compilers are based on Free Pascal 0.99.5c, this revision has not been
released for the x86 but is similar in effect to Free Pascal version 0.99.5
except that all known code generation bugs known from FPC 0.99.5 have been
fixed.

You can get the compilers at:
ftp://tflily.fys.kuleuven.ac.be/pub/fpc/dist/

Help is required to port to other 680x0 operating systems:
- Atari native TOS port
- Linux-m68k native port
- Macintosh port help

Please if you can help, contact me via *e-mail*, i would do this port myself,
but i do not have access to these operating systems.

>which is exactly what I need to do. Any ideas..?

I know it's difficult to explain - I've been through it myself with
Pug!

Pug uses a philosophy that the cursor should always be off and only
turned on when absolutely necessary, rather than the more obvious idea
that the cursor should be 'mainly' on. It keeps track of the cursor
status info for each window it is handling and just about every
message results in the cursor being turned off. If memory serves, the
only place it can possibly get turned back on again is in the code
just after walking the redraw rectangles, provided the window had a
cursor status of 'on' and the window is the top one.

Tbh, if I'd known back then the trouble the cursor was going to cause me I'd have written my own code for it: I suggest you do exactly that, especially if you want multiple cursors, background cursors, or scrolling edit fields. It'll be much easier in the long run!

>
>I do not really understand this, partially because information is missing
>(like the AND and XOR masks),

That idea was pinched from the Acorn BBC computer operating system
calls. By selecting appropriate values for AND or XOR you can
selectively read and/or write bitflags. It went very much (if not
exactly) like this:

```
SOME_OS_CALL:
current_bitflag -> copy
current_bitflag &= ANDV
current_bitflag ^= XORV
return copy
```

Thus, a simple read would be
`oldval = SOME_OS_CALL(0xff,0x00)`

Setting bit 0 would be
`oldval = SOME_OS_CALL(0xfe,0x01)`

and so on.

>but to me, "written back to the interrupt
>mask" and "can be called from user ... state" is a contradiction.
>
>What's the goal of this bit ?

The idea is that the interrupt flags can be interrogated or altered from userstate or superstate, as cp_irq shifts state accordingly. I've never had a reason to use the call (it got implemented for completeness) and have never tested it either. Therefore I just wondered if it would actually work.

```
/* set level to 7, return old level */
oldval = cp_irq(0x0000,0x0007)

/* do something */

/* restore level */
cp_irq(0x0000,oldval)
```

I can't remember / don't know exactly what you asked but ...

You don't have to draw the object on the screen: the object gets
written to the logical screen base. It just so happens the physical
screen base is usually the same. There's nothing stopping you
allocating memory for a "shadow" screen and setting the logical screen
base to that instead. However, when you do this you affect
everything - not just your own program so the answer is still "no".

What you could do, is write a little utility to draw your object
tree(s in turn) on the screen, blit to memory using the vdi and dump
it into a file. Your program proper could subsequently load the image
and blit it back on screen as required. You'll have to deal with
resolution problems etc yourself though.

>Does anyone recall reading this and where, or otherwise knows
>how to do this? Thanks.

Yes, Erno Meffert did it.
Trick:
remove connection of Timer_D output to the reciever and transmitter
clocks
so disable connection pin 16 to 7+10 of MFP

Next step:
take clock of pin 18 MFP and divide by 4 with an 4040 chip.
Resulting clock into 7+10 pins
Let this signal be divided by 16 in de USART part of the MFP.
So you get 38400 kb.

2395. When is a menu?

Newsgroup: comp.sys.atari.programmer
Date: 1998-10-03 00:00:00 UTC
From: B O'Donnell <odonnllb@indigo.ie>
Message-ID: <361580C1.48D8BF8D@indigo.ie>
Source record: 3610

Possibly I'm missing something obvious, but all I know about menus is that they are object trees that contain objects of type G_TITLE (for titles:-)), and G_STRING (for the drop-down menus, but I use them for captions in ordinary dialogs as well) and a few G_IBOXES and G_BOXES. However, if you load a resource into Wercs without a hrd file, it correctly displays the menus; does it just run down the options, or is there an easy way?
Alternatively, does anyone know where I can get source for a resource editor. I'm trying to write one for the PC, and menus are the biggest, but not the only, puzzle.

There should be no problem getting Lattice 5.5 to work on a Falcon.
Under MagiC you must run XMEN_MGR.PRG to get access to the options
menus.

> *everything* - not just your own program so the answer is still "no".

There are other reasons. This won't work with external graphics hardware,
i.e. graphics cards etc., as they usually bring their own VDI which doesn't
necessarily use the concept of a logical screen base.

You'd be better off telling us what you intend this for, there are probably
better ways than drawing the tree in hidden mode.

> What you could do, is write a little utility to draw your object
> tree(s in turn) on the screen, blit to memory using the vdi and dump
> it into a file. Your program proper could subsequently load the image
> and blit it back on screen as required. You'll have to deal with
> resolution problems etc yourself though.

It's not only that. Different AESs will draw the tree slightly differently,
so again portability is lost.

Cheers Peter

The only difference between a normal object tree and a menu is the
menu is less flexible in its components, and they must be arranged in
a certain way. Unfortunately I do not have the specifics at hand.

>However, if you load a resource into Wercs without a hrd file, it
>correctly displays the menus; does it just run down the options, or is
>there an easy way?

This is typical of all resource editors. What do you mean by "easy
way"?

>Alternatively, does anyone know where I can get source for a resource
>editor.

Sadly, I cannot help with this either.

>I'm trying to write one for the PC, and menus are the biggest,
>but not the only, puzzle.

Now I'm curious. Please elaborate! ;-)

The correct order AFAIK is (Starting with the highest priority):

IERA 7 Monochrome detect
6 RS232 Ring indicator
5 Timer A
4 RS232 Recieve buffer full
3 RS232 Recieve error
2 RS232 Sender buffer empty
1 RS232 Sender error
0 Timer B/Hblank

IERB 7 FDC/HDC
6 Keyboard/MIDI ACIA
5 Timer C
4 Timer D
3 Blitterchip ready?
2 RS232 Clear To Send
1 RS232 Data Carrier Detect
0 Centronics busy

> Thanks,
> -=Levien

You're welcome.

While we still are talking about the MFP, is there anyone who knows if these are
the correct bitdescriptions for GPIP and AER?

GPIP/AER 7 Monochrome detect
6 RS232 Ring indicator
5 FDC/HDC busy
4 Keyboard/MIDI ACIA IRQ ???
3 Blitterchip ready ???
2 RS232 Clear To Send
1 RS232 Data Carrier Detect
0 Centronics busy

In fact there's a solution, I have do a program witch generate C for GEM,
very easy to do utilitys programs with GEM. It work only with GCC, but
the problem is the installation a little bit hard, without
good documentation and it's in french, so if you speek french it's
avaible if you want.

Source record: 3622

Hello again,

Following Terry's advice I checked to see if XMEN_MGR.PRG was running and it *was*, however I then discovered that if you do *not* run XMEN_MGR then the cascading menus in Lattice C 5.52 do work under Magic 5.11.

However it is still not possible to launch a GEM program from within the IDE without putting Lattice C in limbo (the only way to get it back is a reboot). But at least this means I can start programming and switch to Magxdesk to launch programs. Once I get more proficient in C I may consider the upgrade to 5.60, but I don't think it is worth it for compiling "Hello World".

>Is interrupt line 0 (BUSY) highest or lowest priority?

According to atari ProfiBuch:
in case of an ST MFP only (TT is somewhere different with 2 MFP's)
highest channel nomber and priority has I?o port 7 (I7) monochrome
detect

lowest (0) has I/O port 0 (I0) BuSY of par.port.
In Atari ST Ram the adres of the interrupt auto vector for the
normally not enabled MFP int. nr. 0 is $100.

Checked them with Atari Profibuch:
On adres $FF FA01 is "GPIP"
bit 1,2 and 6: used for serial handshaking
4 for ACIA both, "who did it?" by checking ACAI statusregisters
5 indeed floppy controole ready after command execution
Alternatively: ready transport on DMA-harddisk port
nr 3 from blitter chip; the GPU-Done

Source record: 3626

I'm currently trying to mix assembly language and C in a project
with Pure C 1.1 on a falcon. It works fine with small programs, but
it generates bus errors with bigger ones (.prg file > 80 Ko)
it's probably a specific option to use during the compilation but I
can't find it.
Does anyone encountered the same problem ?

Thanks.

Menus also have a certain structure, so it's quite save to guess wether an
object is a menu or not.

> Alternatively, does anyone know where I can get source for a resource
> editor. I'm trying to write one for the PC, and menus are the biggest,

Do you know about ORCS? It`s a shareware resource-editor. There are
versions available for Windows and Windows NT. They still use the GEM RSC
file-format however, so there is currently no way to convert them to
RC-files, if that is what you are trying.

```
The manual is may be not very clear but correcting the assumptions
the dis-assembler makes is easy.
Say: in the middle of some valid code there is data.
Wrongly that can be taken as (mostly non-sense) code.
Put your mouse-pointer on the offending mistake and press 'B'-key.
Then it is displayed as (byte) data (or use W or L).
The same way around:
when code is wrongly taken for data use 'C' to interactively put your
own intelligence to work!.
Also pseudo-labels that are wrongly generated disappear.

Yes. It's a shame that the HYP is only available in Dutch! I wonder
whether it has ever been translated.

Anyway .. it's a nice piece of work and I'm going to be fascinated to
find out how to use it well.

Hi Michael,

> So does this mean that Lattice 5.60 *does* work with a Falcon or not?

Yes.

> Does anyone know what the major differences are between 5.52 and
> 5.60?

5.6 Enhancements:

* MiNT/MultiTOS memory protection flag is now variable.

* Mon now works on Falcon with special enhancements.

* Compiler now supplied in .TTP format too.

* m0 and m1 are the start and end address of a binary file, m8 and m9
are spare.

* Mon has Widen Window command.

* Mon now has Start at Label feature.

* Tools: make, ar, dr21c, lprof and lstat are now included.

* Manuals are no longer ringbound. (Is that supposed to be an
enhancement?)

That's everything on my list.

John.

abother thing nice to know:
when you have given 'labels' generation you will find code statements
containing adresssen 'by label-name' Click on the labelname in the
code and your cursor is placed whre that label is placed.
Go back to where you came from with 'undo'.

>Previously I have used Easyrider v4 but this has been giving some

It should not be a problem. The maker knows that things like TOS blow
up in ascii-tekst assembler listing as 2.7 Mb.
The biggest I know that was done was 1.4 Mb program code.

If you are using PC-relative code (like lea $20(pc), a0) this may happen. Of course, you should also get a linker error in this case. You should make sure you do not have warnings turned off.

2430. File Handles ?

Newsgroup: comp.sys.atari.programmer
Date: 1998-10-10 00:00:00 UTC
From: Brent Thirsk <thirsk@telusplanet.net>
Message-ID: <361F4CF4.53C4@telusplanet.net>
Source record: 3645

I am running Mint 1.14.7 with mintos on a TT030 with 4 attached
terminals.
When running several instances of the same application, are file
handles for disk files the same over the system regardless of which
application is opening a file.
eg: If each process uses file # 48 for a particlular file, and one
tries to access the file while it is already opened by the other
process, does the system handle this file as the same for both
processes, namely reporting the file is already opened, or as seperate
occurances.
As I have mulitple iterations of the same process on terminals, these
processes of course treat files in exactly the same manner.
Also when a file is opened, is time sharing stopped until the file is
closed.
I occasionally have a program quit when 2 terminals try to access the
same file a the same time.
This problem only occurs on rare occasions, about 4 times in over 1000
hours of running.
Any suggestions that will help clarify this would be appreciated.

> Does anyone encountered the same problem ?

I think you'll have to be more specific. I don't use PureC myself - does it allow inline asm for instance?

There's a chance the problem might be due to pc-relatative code generation or short branches - but I'd expect some kind of compilation message if that were the case. Generally speaking though, it's more likely to be simply a logical flaw or register corruption and that the size is co-incidental.

>Michael

I have experienced the occasional going into "limbo" of Lattice
under MagiC after launching another program within the shell. You
usually can get back to Lattice, however, as long as you finish the
process launched under the shell. Sometimes Lattice seems to have
disappeared even after the process is closed. Something silly, like
closing a window in Magxdesk, usually restores it to its proper place
in the MagiC list of active programs. I have no idea why that is.

I do not know if you ment file handle #48 or the filename #48
but if you are using the same file in more than one process
maybe you need to sync the read/write with a semaphore.
You need to open the file in a new process to get a new filehandle.

> As I have mulitple iterations of the same process on terminals, these

The time sharing is working when a file is open.

If you have problems with pure-c, you can have a try with assemble.
This assembler produce a code compatible with "plink.ttp". Moreover
you can use "make" with it, even if you are in single task mode (with
or without mint).

I've been using the MagiC task manager to do just that - terminate the
launched processed, but I haven't tried doing something in MagixDesk to get
Lattice back. Like you say it is missing from the list of active programs.
I'll give your tip a try.

The files are opened by each process individually. The processes
just use the same Identifier internally. #48 is the file Number used
to access a specific file. This is GFA Basic code. Assign a file Number
to a file when opened and accessed.

This term is UNIX.
Semaphores is like a global "lock variable" but it can be used by all
processes that knows the name.
To use it there is a system call in mint called Psemaphore()
this can be used for many things but in your case it can be used
when you writes to the file and lock other processes from reading/writing
and the prevent them to get false or corrupt data.
As mint is preemptive multitasking you can get strange result if two processes are
accessing the same file.

More about semaphores can you read in the book "The Atari Compendium"

2442. Lattice C w/Wdialog

Newsgroup: comp.sys.atari.programmer
Date: 1998-10-14 00:00:00 UTC
From: rojewski@primenet.com
Message-ID: <70160o$ql1$1@nnrp02.primenet.com>
Source record: 3557

NEWSie is programmed in Lattice C. Wdialog was developed w/Pure C. Lattice "wants" to use Address Register 4 (a4) for a Global Data pointer.

The Wdialog specs specify on the service-routine:
"The routine may use registers d0-d2/a0-a2."

With the version of Wdialog built-in to Magic 5.03, NEWSie has no problems using a4 (via the __saveds function). With Wdialog 2.0+, there is a distinct BOMB when NEWSie tries to Edit Nicknames.

What can be done? I have tried saving and restoring a4 before returning from the service-routine. It still works on the Magic version and still bombs on the Wdialog 2.0+ version.

It may not be a4 after all, but that is all I can thing of.

I also get "Invalid Handle = n" messages with Wdialog 2. What does this mean?

John

From: atarist@xs4all.nl
Message-ID: <702ourbj1@news2.xs4all.nl>
Source record: 3559

So me questions arouse about the FIND use in the disassember TT DIGGER
I translated a small piece of the manual:

Find

.. Address... (A)

Goto this address

.. HEX code... (H)

Search for a combination of bytes (in hexa)

.. TEXT... (T)

Search for a ASCII-tekst.

.. Reference... (R) of (V)

Search for a 'relative' reference
This is for finding fast the place where a label or address is used
In hexa
Label should be typed with or without pre- R T U or X
Searching starts at current position (default)

Realative references (type Bcc, DBcc, dd(PC), d(PC,Rn)) are
put in the first sentence in the window

When searching relocatable PRG-file (.PRG .TOS .TTP .ACC .APP .O)
only relative en relocatable adressen are found In other cases also
absolute adresses.

Met vriendelijke groet,
Ronald van der Kamp

Dear Roger Cain,

..disassembly starting at $0AB82

You can go to any part of the display of the listing by using the
sliders of the text window.

Th philosophical difference between 'Find..' and 'Search..' is
sometimes vague I agree.

Met vriendelijke groet,
Ronald van der Kamp
secretaris Stichting ST

Hello,

- new list of CENTurbo II compatibility softs. Thanks for user
to send me your test.

- new versions of CENTscreen (3.3.1) and VIDEOMODE (1.1.0)
on the site. The goal of this version is to correct a bug with nvdi
which didn't change resolution if the boot and the desktop have
the same colour depth.

- the PATCHCT2.ZIP (on CENTURBO II page) contain a modify
SCC.PRG (HSMODEM) to run correctly on CT2. The original
think that SCC is on 14MHz master clock instead of 8MHz.

2448. Disassembling problem in TT-Digger

Newsgroup: comp.sys.atari.programmer
Date: 1998-10-15 00:00:00 UTC
From: Rainer Wessel <vvb-organisation@t-online.de>
Message-ID: <7053nf$2tq$1@goof.de.uu.net>
Source record: 3563

Just tried TT-Digger on a larger program and it's really good. It's fast and more reliable than EasyRider (especially in HiRez), which I used before. And it runs smoothly on my PC-based Atari emulator.

There is, however, one problem I came across: It refused to disassemble the directive
andi.b #5,-22(a5)
regardless whichever way I tried. All it produced was a DC-sequence.
Converting between code and various data-formats (b, w, l) didn't work.
Maybe I missed something in the manual (my Dutch is only rudimentary).

Oh yes, that 'FIND'-thing again...:
As there seems to be some problem or other with accessing the FIND-functions, here is my contribution:
How do I look for opcodes? For example, searching for 'dc' to locate disassembling problems (EasyRider has a special function 'Find next data position' for this).

Greetings

Rainer

User-interface is a little unusual, but I think we can access it..

Well, I've been gem and magic programming for years and I currently use lattice c (not c++) , Asm (for the fast routines) and (mostly) Hisoft basic. Both lattice and basic come with pretty full libs to use system functions although the docs are sparce so try and get hold of something like the Atari Compendium which, with all it's errors, is stil the best I've found. The asm has very few libs but then really u don't use many in Asm anyhow.

As far as graphics etc. these are a combination of system commands (windows, menus, etc.) and a resource file (the .rcs file extension). Lattice and Basic come with a program called WERCS but it is pretty dated and doesn't like magic or Mtos. I use Resource Master (v2) which is shareware and Interface (comercial). Both of these support the magic enhancements and things like colour icons. Also, they both save the header files (that hold all the names u have given to the objects) in multiple language formats. These are both point and click based but NO code is added to objects (unlike in visual basic for instance). The rsc file is loaded in to u're program using system commands and the items are drawn on screen when and where u say.

I must warn u it takes a lot of patence (esp. when teaching u'reself) to program gem but I'm sure u'll get loads of help from the likes of these newsgroups :)

> correctly displays the menus; does it just run down the options, or is
> there an easy way?

May I suggest first that u get something better than WERCS ? Something like resource master.

Basically, in theory, ignoring the limitations, any object tree could be a menu - u just have to tell the system that the object tree is a menu using one of the AES menu commands (don't have the referece books handy - sorry). However, the AES really doesn't like it if u try and draw some things in a menu bar so the safest is to limit u'reself to the objects u listed above. Also, the same menu command allows u to shange the menu bar at any time during the program and a similar construction to a popup menu object tree can be used for submenu's which are attatched using other aes menu commands - everything is listed in the Compendium and a number of other books.

Resource Master and Interface both allow u to change the type of an object back and forth between menu and dialog - as long as it contains no illegal menu items. This means u can change the bg colour of menu's, make them 3d etc. The only probs with this is redraws don't work quite right on some aes versions.

2451. Re: Lattice C w/Wdialog

John M Rojewski wrote:

> The Wdialog specs specify on the service-routine:
> "The routine may use registers d0-d2/a0-a2."

This is pretty normal - I think Lattice does the same. Basically don't ever expect any routines (esp. in asm) that have stuff in these registers to have the same contents after calling a system or general c/c++ function.

>
>
> What can be done? I have tried saving and restoring a4 before
> returning from the service-routine. It still works on the Magic
> version and still bombs on the Wdialog 2.0+ version.

Sounds like it's not the a4 stuff then. Anyhow, 1) u can change the a4 usage in Lattice (but then it doesn't garentee compatability with the libs) and 2) lattice should take care of all that lot anyhow (there are asm instructions to do all that for u).

> I also get "Invalid Handle = n" messages with Wdialog 2.

What is the handle for ? Window, file or what ? The most common prob is u've passed a pointer to the handle where it expects just the number or vice versa and it is (in the first case) getting a large number of a memory address instead of say a simple int value like 1 or 17 or something for the window handle :(

Check the handle variables and make sure the right stuff is being sent to the functions.

Robert.g

PS - any luck solving the multiple mailbox crashing problems yet - u have heard of these yes ?

Yes. It's quick, isn't it! I have been using it quite a lot over the
last 2 days and am getting used to it. I have had to learn a whole new
series of operations as I am so used to Easyrider.

>Oh yes, that 'FIND'-thing again...:
>As there seems to be some problem or other with accessing the

>position' for this).

Yes. I don't think there is an equivalent to this. When I have needed
to find an opcode I have just used the Find hex function. So, looking
for move.w <imm> d0 I have done a hex find for 303C.

Easyrider was giving me increasing problems so I shall try to learn
how to use tt-Digger effectively.

Greetings atarians!

Now I have a new stupid question for you all.. 8)
Do installed and active applications (as ST-GUIDE, COPS, etc) send any
data to message buffer that can confuse other running progs?

The reason that I ask this, is because I am experiencing some trouble
with my GFA-GEM routines, but problems _ONLY_ occur when it comes to
co-existing with *ACC:s. It could of course be a bug in my code, but it
seems as if an already occupied handle is supplied for the ACC. Any
idees..?

Thanks in advance,

Joakim

This is a good program. I used it to give me a disassembly
of the BJL modified ROM for the Jaguar and it did a good
job.

But, I wanted to be able to have a listing with both
to hex codes and the disassembled listing. I don't read
German very well, is there another program that has
english pull down menus?

Also, is there someone out there who can give me the
low-down on the idea and simple layout of what a
Transputer is? I remember Atari working on making these
type of computers, but I never paid any attention to
them back then. I'm curious about what it was.

Yes your program can receive messages from other applications and ACCs
If your program don't understand the message received just don't care about it.

If you give options: hex/asc + opcodes + labes + symbols

and do a 'save as...'

then you have everything.
Or not?

For the rest: the manual is in Dutch, you can say a kind of dialect
from German spoken bij 13 million people.
We even have a writer with a literary Nobel-Prize :-)
But I believe that was before my time...

Do not read further....
I have found the reason for the trouble with searching and finding.

THERE IS A BUG!

Normally you can count adresses decimal. Why do it hexadec?
Only because some stupid assemblers expect in de instruction code all
numbers automatically to be in hex?

When you do decimal representation the 'FIND' goes well.

GOOD NEWS:
The maker expects to have a real manual in English within a few days.
Then the rest of the world outside Holland can wallow in comfort with
TT-Digger.

Other news:
the 'bug' of the andi. is no bug but a feature. Because of the
construction of the instruction.
Motorola manual says:
-
This instruction is used to AND the immediate data present in the
"succeeding program memory locations" to the destination operand.
-
Met vriendelijke groet,
Ronald van der Kamp
secretaris Stichting ST

The problem with find is: use for the moment the 'decimal'
representation. Talking the the auteur resulted in 'a bug, that will
be repaired'. Somewhere in the internal conversion the hexa notation
screws up.

If all is well, he has contacted you by e-mail. But for the rest of
the world:
the #5 works with an logical AND on the data in the succeeding memory
location. That location is not part of the instruction. Because
instructions are aligned on even adresses, from the following 16 bits
only 8 (the .b ) are used.

It's not a directive, but that's of course beside the point.

>> andi.b #5,-22(a5)
>>regardless whichever way I tried. All it produced was a DC-sequence.
...
>the #5 works with an logical AND on the data in the succeeding memory
>location. That location is not part of the instruction. Because

Someone must be misunderstanding something here (could be me, but I
doubt it). 'andi.b #5,-22(a5)' is clearly a correct instruction and
should of course be disassembled properly.
Both the number and the effective address specification are part of the
instruction, only they're in extension words rather than the opcode
itself.

From another message:
Motorola manual says:
-
This instruction is used to AND the immediate data present in the
"succeeding program memory locations" to the destination operand.

This simply means that the '5' is located in a word following the actual
opcode, like in just about any instruction with immediate data. There's
no difference between this and a 'move.b #5,-22(a5)' for example or
even 'move.b #5,d0'.

>instructions are aligned on even adresses, from the following 16 bits
>only 8 (the .b) are used.

How is this relevant to the supposed bug?

All gcc versions can 'easily' be built as cross compilers. I've done
this several times myself on the Mac and Sun I use at work.

Note that this only gives you the C/C++ to assembly part.
The GNU assembler can of course also be cross-compiled, but I've never
tried that. Then there's the problem of finding a linker that can output
a standard Atari .PRG file.
Still, the actual compilation is what takes the vast majority of the time
and you'll have to transfer some files to your Atari (or perhaps emulator)
sometime anyway.
```

If you don't want to rebuild everything yourself, you'll of course have
to look around on the net for something pre-built. I have a DOS-based
68k gcc/g++ at home, but I can't remember where I found it.
Check out the homepages of some commercial GCC support company
(there is at least one, but I can't remember their name.

You have to use the Atari as/ld (the current BFD-based binutils do not
support TOS .PRG binaries). I am told that this will work fine - Frank
Naumann (MiNT kernel maintainer) just did this ...

Myself, I am using a modified gcc/egcs built as a cross-compiler for
m68k-unknown-coff (using the current binutils) to compile the current Milan
TOS on a PC.

In every case, you probably habe to compile your cross-compiler on your own.
On a Unix system, this will be relatively straightforward (if you read the
crocc-gcc FAQ), in w Windows/cygwin environment, it might be a bit more
tricky, but I have heard reports on the cross-gcc mailing list that it does
work.

I immediately remembered this.
The following is the case:
because it is a byte size operand, the immadiate value must be put
in bits 7 to 0 of the following 16 bits word.(least significant byte.
Now if there are bits set in the most significant byte I have to make
a choice: If I disassemble the instruction I can not both produce a
valid instruction and show you those bits. Although the processor
ignores these bits. TT-Digger is primaraly a diagnostic tool.

Henk Robbers.
If this is not the case I gladly hear from you.

A new version of TT-Digger is available with the FIND working good (I
hope).
Download of new version (I only live 24 hours a day) will be
possible end next week.

For the rest: maybe this weekend all ready a ENGLISH MANUAL!!!!

2471. Help with Wolfenstien 3D STe conversion

Newsgroup: comp.sys.atari.programmer
Date: 1998-10-24 00:00:00 UTC
From: martin.w6@ukonline.co.uk
Message-ID: <3631db76.4699163@news.easynet.co.uk>
Source record: 3586

I've got a friend whose keen to do a Wolfenstein 3D
conversion to the STe now that he's learned assembler.

I wondered if anyone out there has any faqs, C source or
knows if this project was ever started elsewhere so he could
pick up the pieces.

Also what do people think, is it possible?

Personally I think the STe could pull off reasonably well.
The STes enhanced features while not amazing should make
some difference to speed especially with sample playing.

Wolfenstein 3D works on a 286 PC with 640k base memory and I
think about 256k expanded memory.

At the moment he's working on a basic 3D engine so he can
understand perspective.

It will probably get released first as a simple graphic demo
and then possibly a simple deathmatch game when connected to
another STe before becoming the full game.

It will probably make use of its one custome sprites but use
wolfenstein level data ripped out using a supplied util

I.e. you can play the levels but no new wall testuxes or
creatures.

This is because of the 16 colour limitation and any attempts
to improve on this would slow the game down. Attempting to
dither or simply ignore extra colours would not be feasible.

Its more than likely that the game play area will be derezed
slightly with a small border although accelerated models
will obviously be able to avoid this.

The PC version has an effective playsing screen of about
300x160 approx with maximum border about 100x53.

The ST version will probably have a resolution of 120x80 but
be doubled both vertically and horizontally to give 240x160.
I.e. every 2x2 pixels are the same.

It might look blocky but will at least be playably fast.

The status bar will look much the same as any Wolfenstein
and the gun will probably be pasted just below the playing
screen i.e. not protruding into the main action screen.

Its not expected that wolfenstein music files will be utiliised.

Personally I think if he can pull it off it will be the best ST game ever because Wolfenstein is so playable.

Whle it may not compare to more sophisticaed versions the death match facility will be exclusive to the ST version.

The final engine will probaly retail at £4-6 for shareware registration but no more than this. Which should offset some costs without actually being profiteering.

This is a serious project which I hope will stay on course to the end.

At this point I'm trying to collect as much information as possible about Woflenstein. Please don't attach anything to emails without a plain email first telling me what you have.

Please don't reply with any 'can't be done' type letters it obviously can be. In fact Substation is a more impressive engine (its just a not very playable game). The question is will it be ok speed or a decent speed.

2472. Bigdos & Rwabs

Newsgroup: comp.sys.atari.programmer
Date: 1998-10-24 00:00:00 UTC
From: Pera Putnik <piters@eunet.yu>
Message-ID: <70tb5b$k1n$1@SOLAIR2.EUnet.yu>
Source record: 3587

I write currently driver for IDE hard disks for Atari (ST) machines. I want also including option for work with PC (MS DOS) format hard disks. I made simple routine which swaps High/Low bytes in word, and it worked very fine with PC disk. But for now only with 'normal' or Non-Bigdos partitions under 32 MB. Of course I want writing routines for work with larger partitions, up to 2 GB - nobody uses still such small partitions. It should work with program BigDos.
I think that it will be useful, since most of PC-s are equipped with IDE drives. Btw. what is by SCSI drives ? Is High/Low byte order reversed also ? Sadly I don't have SCSI interface on ST to check it.
Well, what I need is some help about writing that BigDos capable driver. I suppose that extended Bios function Rwabs contains additional 16 bit data of starting sector of block. I saw also some additional fields in GetBPB function, or it is new-extended function ?
So, if anybody could, please send me infos about these. I write driver in 100% assembler, and I don't know programming in C.
It would be best if you send me how put parameters on stack by function call - like in Atari (ST) Profibuch.
Also some infos about XHDI 1.2 will welcome. Some link, literature, anything.

Pera Putnik

I don't think you can. I believe Linux requires a 68030 processor (at least) to deal with the memory management.

I may be wrong!

You cannot. Linux and NetBSD require at least a TT or a Falcon.

Your best bet is to install MiNTos, using the KGMD package or
the english version KEMD_R2. See http://kellis.atari.org for
more info about it.

> where can I found that ??

The released version of 68K linux requires a 68030 and an FPU. The STE
has neither of these.

It appears there might be a version compiled for a 68000, but I don't
know where.

You might rather go for MiNT, which is very Unix-like, but also TOS
compatible. There are many unix utilities that have been ported to MiNT.

Cheers,
Nick

>obviously can be. In fact Substation is a more impressive
>engine (its just a not very playable game). The question is
>will it be ok speed or a decent speed.

Ofcourse it can be done...
Just at what speed..
And substation doesnt really do texture mapping does it ?

Just some doubts i have about this working on ST well.
esp. after some experiments on the falcon.
And that comment you made about 'now that he's learned assembler'.
I dont wanna sound arrogant or anything, it just doesnt sound to hopefull to
me.

Anyway, just my thoughts on this.
Feel free to mail if u like to have Wolf3D sources.
I must still have em somehwere.

> [snip...]

I see, so the problem was some bit-dirt in the most-significant byte. I
don't know what assembler/compiler was used for the original programm I
disassembled (some C-compiler, I guess) because this occurred in all
instances of above instruction.
EasyRider didn't seem to have any problem here, although this clearly means
losing those higher bits. I know the distinction between code and data (in
the text segment) is one of those knacks a disassembler has to worry
about.The only thing that worried me is that TT-Digger could not be prompted
(or forced) to turn the data into 'possible' code :-].
Otherwise TT-Digger has proven very reliable and fast.

2484. Sozobon question

Newsgroup: comp.sys.atari.programmer
Date: 1998-10-28 00:00:00 UTC
From: rosco@game-master.com
Message-ID: <363747dc155bf80@game-master.com>
Source record: 3598

I've just started to explore Sozobon and I've come up with this problem involving getche():

```
#include <stdio.h>
void main()
{
char ch;
printf ("Press the ~ key to stop\n");
for(;;)
{
ch==getche();
if(ch=='~')
{
break;
}
}
printf("\nDone!\n");
}
```

When I compile this with -lextra I get a warning from hcc - "implicit decl of getche".

When I run the compiled program the characters echo to the screen as expected but hitting ~ has no effect.

What is the warning from hcc about?

Don't know what the warning is about but there is an error in your code.
You're trying to assign ch with the return from getche() but what you did with
2 equal sign ("=") is a comparison operation. It should be single equal as
below:

ch = getch();

2491. TT Digger new +Engish manual

Newsgroup: comp.sys.atari.programmer
Date: 1998-10-29 00:00:00 UTC
From: atarist@xs4all.nl
Message-ID: <71amviidl2@news2.xs4all.nl>
Source record: 3506

Today a new version of the intelligent interactive dis-assembler

TT DIGGER version 5.3

is available for download.

Following some bug-reports repairs are done.

The 'Search...' can now lead to a 'Find'.

Also there is now a Engish manual in HYP format.

get it from

http://www.xs4all.nl/~atarist

From the homepage goto Download.

For persons who do not know:

all kind of files containing 680xx CPU codes can be made readable als
mnemonic machine-code.

Met vriendelijke groet,
Ronald van der Kamp
secretaris Stichting ST
atarist@xs4all.nl

>I have tried everything but still cant get a hold of them.

There is a patch for GFA-Basic that fixes the compiler library and
it's very useable once patched.

I think HISOFT is unsupported as well but I could be wrong.

STOS from what I've seen is great for games.

Someone else answered you on the warning message.
I don't use Sozobon at all, but could it be that the prototype is inside
tos.h or ext.h oe something equivalent ?

Otherwise just create the prototype yourself.

```
The first error is writing ch == getche();
In this case the returned value of getche() is not affecting the 'ch'
variable. Instead you should write :
ch = getche();

The warning can be avoided by prototyping the geche() function.
Type just before the main() function :
char getche( void);
```

>Otherwise just create the prototype yourself.

The book that I'm learning from specified conio.h, which wasn't
included with Sozobon. I DL'd a conio.h file off the web, and it had
the prototype for getch() but not for getche(). So, as you suggested,
I created the prototype myself, and this cleared up the error.

Until yesterday, I had no idea what a prototype was. This is *all*
new to me, and I'm really glad that it's starting to fall into place.

Thanks for your help.

>instances of above instruction.
No, no,
the thing here is: the contents of that left-ver byte is according to
the instruction description not used.
Nowhre there is declaired that thosebit should be zero.
Most compilers make those bit 0 but maybe not.
Also there are some clever programs that keep their secret licence
number in those bytes.
When you translate the instruction code to readable form: you cannot
see that byte-contents.
To make sure no information-los to the user takes place, no dis-
assembling is done.
Of course having a listing you can put that abdi.b instruction in.

>EasyRider didn't seem to have any problem here, although this clearly means
>losing those higher bits. I know the distinction between code and data (in
>the text segment) is one of those knacks a disassembler has to worry
>about.

The only thing that worried me is that TT-Digger could not be prompted
>(or forced) to turn the data into 'possible' code :-].

I will ask the maker to put somewhere a choice.

The download URL was wrong. The HTML page states it as a ZIP file while it
is a LZH file. The solution was to type in the path yourself and change the
ZIP part to LZH.

Offhand I'm not sure but 32x32 would be a reasonable guess. However,
you might want to consider implementing something more generic: where
you enquire the iconified window size then centre the icon within it.
This allows (with clipping for safety plus a background fill in case
the icon is smaller) any icon size to be displayed.

It is unwise to do this. You could let yourself in for some subtle bugs!

In technical terms ...
you have explicitly declared getche(). This, the compiler *must* believe until evidence to the contrary comes to light. As no definition for library functions exist this can only occur should a conflicting declaration be met.

In english ...
find the header which contains the real prototype and #include that file instead. Good rule of thumb: Never prototype a function yourself unless it is for one you've written - even then it is best to put the prototypes into their own headers.

setsndmode() is part of an library for the falcon030 and only
implemented
in this tos (with some other functions for the implemented
sound-features)!

it is an xbios-call, so if you like to call it from an asm-module try
this:
move.w #mode,-(sp) ; mode: 0 = 8 Bit stereo, 1 = 16 Bit
stereo, 2 = 8 Bit mono
move.w #$84,-(sp) ; function-index for this xbios-call
trap #14 ; call the xbios
addq.l #4,sp ; correct the stack

If you do not have some documentation of some functions try to use
your pure-debugger!

have fun
guenter

It has always been, and always will be (as far as I know), 32 pixels on a side, just like MS Windows. Except most ST icons are black 'n' white.. :)
Some specialist operating systems or programs may have larger icons (why? there's precious little space already!), and I know some have colour. I just said that as, although I supposed that you were referring to a program operating under normal GEM (such as faST basic with it's icons), you might have gone custom.

Hello,

Note that Mr Paul Finch (Portfolio Club U.K) E-mail address has
changed from pfinch@mettav.demon.co.uk,
To: paulfinch@x-stream.co.uk
The telephone number stays at +44 (0) 181-286-8990 (answermachine)

Please pass this information on to one other person.

Also:

WHAT HAS HAPPENED TO THE TAVERN BBS?

Can anyone help me with the above, which is a London (England, U.K) based BBS.

I was logging onto them approx once a week when suddenly the number just
started to ring and ring but does not log on to the BBS. Yes, all my computer
equipment does work as that is how I got here!

I have even wrote to Mr Paul Baker (the Syops) but no reply!

HELP, does anyone know what has happened to 'The Tavern BBS'?

Paul

2521. For Sale (UK): Lattice C 5.52

Newsgroup: comp.sys.atari.programmer
Date: 1998-11-06 00:00:00 UTC
From: Michael Clemmetsen <mc@syn.beetee.co.uk>
Message-ID: <71uiiq$g42$1@pheidippides.axion.bt.co.uk>
Source record: 3536

Hello,

I have HiSoft Lattice C 5.52 for sale for 20ukp including p&p.

The package includes the following:

Original disks (in HiSoft disk wallet!), manuals and box.

The software comprises the Lattice C compiler, assembler and linker which can all be accessed transparently from the integrated development environment*, a complete set of libraries for writing GEM applications and the WERCS resource construction set. A single setup program installs all the different components into the right places on your hard drive - you can go from opening the box to compiling your first program in about 30 minutes.

The manuals comprise the library documentation for Lattice C 5, an addendum for Lattice C 5.5, a user guide to the editor and IDE and an installation and getting started guide which includes a quick tutorial. They are in good condition.

The box is, ehrmm box shaped - a bit like the type of box you would get a pair of Dr Martens shoes in, with a printed card sleeve describing Lattice C. The sleeve is a little sun light faded on one side.

I would prefer to sell in the UK as it is easier to sort out the money and the p&p is cheaper, but if you live elsewhere and can suggest a means of payment please get in touch.

That's all,

Michael
--
To send me an email substitute @ for % in this address:
michael.clemmetsen%syntegra.bt.co.uk

* Note that the IDE does not work very well on the Falcon - if you have a Falcon I would recomend getting Lattice C 5.6 direct from HiSoft, since 5.6 includes Falcon support. However if you have an ST(e) then this is an ideal opportunity to get a complete development kit for the Atari. I bought Lattice C 5.52 when I had a Mega ST and am selling it now that I have moved to a Falcon.

Would some kind soul please help me with information about how to use APPL_READ
and APPL_WRITE in assembler, my GEM books only describes them (very) briefly.

And can somebody tell me why TOS 2.06 returns two messages thru EVNT_MESAG when
somebody presses the horizontal/vertical arrows? (It only occurs in TOS 2.06,
I've tested 1.02, 1.62, 2.05, 2.06 with TOSbox/PaCifiST and 1.04 on an STfm.)

Message1:
$0018 24 WM_ARROWED
$0001 1 APID
$0000 0 Length
$0001 1 Window handle
$0001 1 Page down

Message2:
$0018 24 WM_ARROWED
$0001 1 APID
$0010 16 Length
$0001 1 Window handle
$0001 1 Page down

TIA - Fredrik Olsson

(If you want my email adress, replace Ebba with an F.)

I do not have any example in assembler
but i include a small C example of sending messages.
It is the idea that counts.

You need to create a 16 bytes message buffert

```
int mess[8];
```

Then you need to setup all positions
and set all unused to zero.

```
/***************** the message ***************************/
mess[0] = SH_WDRAW; /** redraw desk window **/
mess[1] = appl_id; /** my id **/
mess[2] = 0; /** len **/
mess[3] = -1; /** all open desk windows **/
mess[4] = 0; /** Zero **/
mess[5] = 0; /** Zero **/
mess[6] = 0; /** Zero **/
mess[7] = 0; /** Zero **/
/*************** send the message ************************/
shel_write(7,0,0,mess,NULL);
```

In this example i have used shel_write
but the idea is that you create a message buffert
and then put the pointer to this into the shel_write/appl_write call.
Remember that it is not safe to have the buffert in temporary memory
temporary buffert at stack gives problems in a multitasking enviroment as the buffert is
lost
at exit of the function/subroutine.

int16 appl_read(int16 ap_id, int16 length, int16 msbuf[])

Fill the arrays as follows ...

control[0] =11
control[1] =2
control[2] =1
control[3] =1
control[4] =0

intin[0] =ap_id
intin[1] =length

addrin[0] =msgbuf

[make call]

Result returned in intout[0].

... appl_write is *exactly* the same except control[0]=12. Is that
enough info?

From: gmiller@inca.co.nz
Message-ID: <72gokl$r9p$1@newshost.comnet.co.nz>
Source record: 3543

How do I detect and utilise a network within my programs? The only network that springs to mind is Mintnet, but I assume that there are more, and I've just forgotten about them.

For example, I am running on machine #3, which is currently heavily loaded, and running like MS Windows 4.1 (aka Win 98) on a 640k 386SX.

Is there some way I can find out what other machines are on the network, and send a piece of code to an under-utilised machine to be executed?

And, in a similar vein, is there some way I can send a message to/from my app on machine #3 to/from another copy of my app on machine #5?

I assume that there is a lot of overhead incurred in network protocols, and a few new concepts that I'll need to get my head around before this becomes feasible. Are there any decent "Networking your Atari" books I can refer to?

--

All email sent to my inca address will fail, however I can now be contacted via an intermediary : gem at tos pl net. I would like to apologise to the genuine respondents that this may inconvenience.

2529. Start parallel program

Newsgroup: comp.sys.atari.programmer

From: josdb@xs4all.nl
Message-ID: <364c62a22f0ad2@xs4all.nl>
Source record: 3544

Hello,

What's the correct way to start a parallel process under a
multitasking system like Magic. I thought the proper GEM call was
shel_write(), but that only starts the process *after* the main
program has quit. Oddly enough, Pexec(), with mode 100, works! But is
it the proper way?

Actually, there are numerous text books on this subject, usually
under the topic of "Distributed Operating Systems". Since true
multiprocessor systems is still in (relatively) early development,
there's not a lot of standards out there. In other words, on Atari,
you're pretty much on your own. Have fun!

>it the proper way?

For MagiC ...

shel_write(TRUE,TRUE,SHW_PARALLEL,exe,cmd)

... is the most commonly used.

#define SHW_CHAIN 1 /* same as standard shel_write */
#define SHW_PARALLEL 100 /* launch parallel process */
#define SHW_SINGLE 101 /* SHW_CHAIN for "buggy" Gem apps */

char *exe,*cmd;

'exe' should the the fully qualified executable path/filename. 'cmd'
is the command line which (iirc) can be passed NULL.

Example:

shel_write(1,1,100,"c:\\apps\\everest.prg",0L);

Offhand, I can't remember exactly the first two arguments. One of them
is 'isgem', which if set FALSE will invoke a 'dos' application. The
net effect of this is the program should end up running in the VT52
window. The remaining argument escapes me atm.

Note: for what it is worth, it is possible to launch a singletasking
process and from that process, spawn parallel ones. I found this by
accident from my command shell one day.

One of the problems with Pexec() is that it (obviously) bypasses the
AES somewhat. Thus, should a child process ask the AES about its path
it'll be given the information from the most recent parent Gem
"spawn", not its own path. This can play havoc with its datafiles (not
found, ending up being created in wierd places, etc) - this also
applies to its resource so is usually fatal.

Most people can get away with this simply by coding thus ...

rsrc_load("foo.rsc")

... but this is not recommended. If the user changes the 'dos' path
away from that of the executable then the resource will not be
located. Again, as always, the solution is to use fully qualified
filenames - ie build the path from the information returned by the
AES.

There's a caveat. [Isn't there always?] ...

Standard Gem returns differing information for the aes path depending
on the version. There was even an instance where I found this changed
due to the hard disk driver in use! In many cases standard gem returns
information which is useless. It is therefore advisable to parse/test
the information returned. If it is nonsense then enquire the dos path
and use that instead. Standard gem typically returns information like
this for (say) c:\apps\bob\foo.prg ...

C:FOO.PRG
C:\FOO.PRG
FOO.PRG
[]

I can't elaborate further. Unfortunately I archived all my Atari stuff
with lzh and didn't realise a password was set. :-((

2532. LZH password cracking?

Newsgroup: comp.sys.atari.programmer
Date: 1998-11-14 00:00:00 UTC
From: guy@swampdog.demon.co.uk
Message-ID: <364eaaa8.7977090@news.demon.co.uk>
Source record: 3547

Hi Folks,

I somehow managed to archive all my Atari stuff with LZH shell without realising there was a password set. I've absolutely no idea what that password was! :-(((

I had a look at LHarc from the command line. Even worse news: it appears to return zero status whether it succeeds or fails with "bad table". Therefore, I can't even try a brute force approach. I had hoped this would succeed. I never use passwords so in likelyhood whatever it was would have been very short, therefore the brute force approach (try one key then the next) might have worked.

The only thing which isn't "lost" is Pug (archived again separately) but the subsystem (stuff added to my compiler object library) upon which it relies is in the archive with the password [substitute very many 4 letter words here].

So ... does anyone know how to solve this dilemma, either with an Atari or a PC program?

It does, but only if it is a program with extension .prg or .app.
MagiC refuses to run .tos and .ttp programs with shel_write.

Yes, you can use the AES-call objc_sysvar. It's documented in the
Atari Compendium, if you don't have it let me know and I'll mail you
some info.

I may do a newsletter type thingy next year (or even next month) - but I need your stuff.

Any letters, articles, etc. could you please send to me, preferably in an image (it's gonna be based on DEGAS pictures) any format - I don't care. But you can send them by ASCII, which *is* a lot better.

PS. To receive it if/when it comes out, email me

PPS. It'll be a lot better if I could get my hands on a program called Atari-Text - I think it's shareware, not sure. If anyone could tell me where I can get it from, I'll be greatly appreciated.

Since I don't own the Compendium I'd really
appreciate if you'd send me some details. I
don't know if it matters, but I am using GFA
for programming.

Also, I heard something about that objc-
sysvar requires a newer AES.

Anyway, thanks a lot,

Joakim

In case you didn't see it in the newsgroups my new CD entitled "The Atari ST PD Collection" was released over the weekend. It contains over 200 meg of all types of PD software including Demos, Games, Music, Internet Software, and Diskmags.

There is also a Spectrum CD which contains over 5000 spectrum games plus Atari ST and PC emulators to run them. All the old favourites are included such as: Manic Miner, Jet Set Willy, Chuckie Egg 1&2, Hypersports, Jetpac, Atic Atac, Green Beret, Mikie and many many more.

Both Cds cost a fiver each plus + ï¿½1ukp P+P UK (Rest Of World - Add 2 pounds) and can be obtained from

27 Turbary Walk
Milnrow Rochdale
OL16 4JN
England

Also availible is "The Megadrive Collection" which includes over 250 megadrive games plus PC Emulators.

Cheques/Postal Orders made payable to D Sharples

The first parameter is the mode. MultiTOS's mode 0 which launches a process
depending upon it's file extension ie. .TOS would be in the TOSWIN window,
.PRG would be normal GEM etc. etc. does not exist in MagiC!
So in MagiC you must use mode 1, which has the unfortunate handicap that
you must specify how the program is to be run. ie. is it GEM or TOS.
That's that the second parameter is for. 1=GEM, 0=TOS.

>It does, but only if it is a program with extension .prg or .app.
>MagiC refuses to run .tos and .ttp programs with shel_write.

Not here it doesn't. I've just tried it. :)

shel_write (1,1,100,exe,cmd) will launch the program as a GEM app.

shel_write (1,0,100,exe,cmd) will launch it in VT52. I had some very weird
effects when I launched LINES.APP in TOS mode. I don't recommend it. :)

As I said above, it seems MagiC doesn't have the *smart* mode that works out
itself whether an app is TOS or GEM, but *you* have to decide instead. Seems
a bit stupid to me that!

Just giving it a bit of thought, I guess it wouldn't be *too* hard to code
around it. Might do that in SPAWNER actually. All you need to do is check
the extension of the app your about to launch, and if it's .TOS or .TTP then
use shel_write (1,0,100,exe,cmd) else use shel_write (1,1,100,exe,cmd).

What about it Jos? I'd certainly like to be able to run the import, export, expire functions from Okami's menu in a VT52 menu :)

Gary

2541. Complete C++ setup - where?

Newsgroup: comp.sys.atari.programmer
Date: 1998-11-18 00:00:00 UTC
From: giovanni.ciampa@henderson.com
Message-ID: <72uriv$7m3$1@nnrp1.dejanews.com>
Source record: 3407

Quite a simple question really... I've been trying to set up a C++ system for my ST, but I think I'm missing something.

I've downloaded various versions of gcc (2.5.8, 2.6.3 and 2.7.2), associated other binaries (as, ld, etc.) and the include/library archives. C programs all compile and run OK, but when it comes to C++ I get linker errors link: 'cannot find stdc++.olb' (running g__.ttp - renamed to gpp.ttp - from the 2.7.2 package).

My question is therefore: Is there a 'out-of-the-box' gcc kit that I can download, or what else do I require to fill the gaps?

Thanks in advance,

Gio

Hi to all coders here.
I was wondering if any of you had done, or had seen this kind of
program.
Quite simple (at least it seems):
a TSR that would emulate a hardware JOYSTIK position from the keybrd
cursor. A joystik is more a pain than anything, besides mine sucks.
And plug it in, out, pisses me off more than anything.
Any TSR like that outthere? if not, anyone see if it is possible to do
one? If yes, would anyone attempt such thing?
Bye. and Thanks..

I'm not sure if this is a good idea. I do not know the doex code of 7 ATM, but
it certainly does not exist in older versions of TOS. So if you care about
compatibility with other machines (you should ;-) ) you should stick to
appl_write for sending AES messages.

Cheers Peter

2544. minit.ttp sez: "Can't access Drive I:" -- help!

Newsgroup: comp.sys.atari.programmer
Date: 1998-11-19 00:00:00 UTC
From: strads@tmisnet.com
Message-ID: <3653ca3a.2147495@news2.tmisnet.com>
Source record: 3410

Talk about discouraging ... I had a bare-bones copy of MiNT
working with MiNTnet on my C-Lab Falcon (TOS 4.04, 14 Meg
RAM, 500 Meg drive at 0,0), but was limited to 25 megabytes of
disk space 'cause I didn't have the partitions XHDI formatted.

No problem, I figured, I'll just change the partitions! If only....

So here's what I did (my question is WAY down there):

I got HDDriver 7.55, and created six lovely partitions on my 2,0
Fujitsu (external) drive:
G: 16 Meg (GEM)
H: 32 Meg (GEM)
I: 200 Meg (BGM)
J: 200 Meg (BGM)
K: 32.8 Meg (BGM)
L: 32.8 Meg (BGM)

Changing the BGM partitions to MIX (for minix) caused the partitions
to disappear from the desktop. Minix couldn't find them either.
Worrisome was the fact that HDDriver was counting drives beginning
with D: instead of C:, making my 2,0 partitions H-M instead of G-L.

So I left the partitions as BGM for the purpose of access and removed
HDDriver, restoring the ICD driver that I was using originally. The
drive-count problem was cured, and G-L were accessible as G-L with
both single TOS and MultiTOS..

Firing up MultiTOS (circa March, 1993), I started minit.ttp with these
options to get partition I ready to go: -V -P -n 2 I:

Minit promptly failed stating:
Cannot access Drive : Physical lrecno error".

----- Here are my questions -----
1. How do I convince minit.ttp to format my I: drive (...and also my
J:, K:, and L: drives)?
2. Where in the process do I change the partition types from BGM
to MIX?
3. Is there a definitive reference guide to minit.ttp and the minix
operating system? A book or web page of detailed commands
and tutorial would certainly be appreciated!

Thanks!

Hi!

In article <3653ca3a.2147495@news2.tmisnet.com>,
strads@tmisnet.com (George Crissman) writes:
> 1. How do I convince minit.ttp to format my I: drive (...and also my
> J:, K:, and L: drives)?

You don't want to format, you want to install a filesystem. Beside that, you'll need HDDRIVER or another XHDI-compliant driver. ICD's drivers has always had problems with the physical Rwabs()-modes, and does not support XHDI, either.

> 2. Where in the process do I change the partition types from BGM
> to MIX?

Anytime, but make sure you have an XHDI compliant driver *AND* that it recognizes MIX as an additional XHDI partition type with BIOS-, but no GEMDOS access. If you use RAW instead of MIX, this will not be necessary, as RAW is a standard XHDI type with these features, recognized by all compliant drivers by default.

In HDDRIVER, you'll need to add MIX to the list of additional XHDI partition types, I think it's in the dialog for advanced options. But as said, RAW will work, too, without having to tell the driver about it. MIX is just a more precise description of what type the partition actually is, but doesn't change the way it's handled by the driver or by MinixFS.

> 3. Is there a definitive reference guide to minit.ttp and the minix
> operating system? A book or web page of detailed commands
> and tutorial would certainly be appreciated!

Moment, are you really trying to install Minix OS or not just only Minix FS for MiNT? Anyway, I don't know a better guide to minit than the docs that come with it. Of course, this doesn't mean this guide is well-done, nor does it mean that better documentation doesn't exist - I just don't of any other documentation ...

Ciao

Thomas

I agree - though I ought to mention ...

The behaviour of shel_write() could be due to command shells. Mine,
for instance, makes almost exclusive use of .PRG when in fact the
executables are just 'dos' programs. The idea revolved around the
premise that .TOS never took arguments, .TTP always took them, whereas
.PRG may or may not (or so it seems). I think (it being derived from
unix) that there may have been an issue concerning the ability of an
app to decide itself how it is run - GUI or CMD, rather than forcing a
mode upon it. Certainly there are one or two in my system that behave

like this.

>Just giving it a bit of thought, I guess it wouldn't be *too* hard to code
>around it. Might do that in SPAWNER actually. All you need to do is check
>the extension of the app your about to launch, and if it's .TOS or .TTP then

Naturally, none of what I mentioned above is relevent these days. Any
command shell worth its salt will allow trivialities such as extenders
to be added, removed or changed. That done, a multiple rename of
everything from .PRG to "sumfink more sensible" shouldn't pose any
problems.

Having spouted all that, I just use .APP and .GTP for Gem programs,
and have extended .PRG to mean "could be owt". ;-))

It'll run them - see Gary's reply for specifics.

I have a vague recollection of initially thinking the same myself
however. It *may* have been something to do with the way my desktop
(Ease) was set up at the time (perhaps some conflict with installed
apps), or it *may* have been something to do with the environment (a
variable perhaps). Unfortunately my LZH disaster means I can't get at
the details.

Anyway, the end result was the output appeared on the desktop but I
never noticed to start with because it got drawn over.

Btw, the return value: this'll arrive via a CH_EXIT message.

As far as I know, yes.

If the call did exist previously in an undocumented but functional
manner then someone else will have to confirm it.

Otherwise, the answer reverts to my other post - "tricky!" ;-)

You don't. At least, I didn't, and my minixFS partition works fine. IIRC,
by minixFS partition types are still BGM.

: 3. Is there a definitive reference guide to minit.ttp and the minix
: operating system? A book or web page of detailed commands
: and tutorial would certainly be appreciated!

For minix, I believe Andrew Tannenbaum (the originator of minix) wrote
book on it. Do a search on amazon.com. That said, you're probably not
interested in minix itself, just the filesystem driver for MiNT. I found
the documentation for minit.ttp reasonably clear (although I think it was
in the source, rather than binary, distribution).

What do you want to know? Just about C in general programming C on the Atari (i.e. GEM)? For C in general then K&R is the definitive guide, for programming GEM-apps then C-Manship by Clayton Walnum is rather good, although outdated. "Professional GEM" is freely available on the net and very good if you already know some C.

> Have or will have Prospero C...Dont need guidence on getting another C
> package thank you as this is the only one I can get a hold of..

Prospero is rather outdated, depending on what you want to do you probably want more modern libs. gcc is free and works fine as long as your ST has 4Mb and a harddrivev. If you want to port DOS-applications (DJGPP is some sort of gcc-derivate, isn't it?) then gcc probably is your best bet.

> So please point me in the right direction for tutorials.. hey and if
> theres an idiot guide then all the better :)

There has to be a "C for dummies" available, check your bookstore. But I'd rather recommend K&R (Kernigan & Ritchie - The C Programming Language) which all you need if you already know what programming is all about.

Thats right. I used ICD's Pro Utils (v6.5.5) with my first Mint
installation, and 64 megs is the biggest Minix partition you can
use with it. Do like Theo says, get HDDriver... ;-)

Yeah, but HDDriver's acting really flakey for me! All of my drive C:
stuff shows up on drive D, and the icon for drive C just stays
selected when double-clicked (for about 10 seconds) then deselects
and nothing else happens.

And ... when I select "MIX" for the minix partition, the partition
disappears, even to minit.ttp! So far, I have managed to wall off
almost all of my external drive, trying to get HDDriver to work.
The only recovery that works for me is ICD's driver and utiliities.

Uwe Seimet was very attentive to my email for help -- he answered
within 12 hours (WOW!! Thank you, Uwe!), but the answer was
"you'll need to ask someone else" because he doesn't use minix
that much.

Fortunately, the "someone else" that Dr. Seimet recommended has
emailed me a fresh copy of minit.ttp -- hopefully this'll help.

Thanks!

> This is tricky. It would help if you could give us some idea of what
> it is you want to accomplish?

I guess that the funtion is needed most for
the action on my 3d-buttons.

I have written my own routines to enable
correct clipping when updating window
content and everything is now working very
well even in background mode. But when
updating an object through objc_draw with
clipping rectangle specified by ob_x,y,b,h
then the (if present) outside border won't be
updated. For now I have a very temporary
solution to this. I assume that if the 3dflag is
set, an outside border of 2 pixels is present.

This is a very bad solution (and only works
for 3dbuttons), I know, but I am
not a very experienced programmer and
haven't found any other solution yet.

I just thought I should ask if there is some
way to determine the outer limits of an object
(3d or whatever) including borders, since I
felt it wouldn't be very strange if such a
function existed.

Maybe I am doing everything in a way that is
not the smoothest, but I don't know...

However, if I could use the objc_sysvar,
would it cause on older AES to crash, or
would it just ignore it?

Regards,

Joakim

I suspect HDdriver may be having problems with ICDFMT's
(AHDI-incompatible) extended partitioning scheme. This is happens when
you have more than four partitions, and the "AHDI compatible" option was
not selected when partitioning your hard drive with ICDFMT.

: And ... when I select "MIX" for the minix partition, the partition
: disappears, even to minit.ttp! So far, I have managed to wall off

: The only recovery that works for me is ICD's driver and utiliities.

Like I said, you don't need to change the partition type to "MIX" (or
anything else, for that matter). Leave it as BGM, oherwise (as you've
experienced) the driver will ignore the partition.

This may be overkill, but I would suggest backing everything up (always a
good idea anyway, when you're messing about with changing file systems
and partition types [as I know from personal experience :P]), and
repartitioning your hard drive (using ICDFMT) with AHDI compatibility ON.
(Ignore if your drive was previously partitioned this way...)

Hi!

gokmase@my-dejanews.com wrote:
> I just thought I should ask if there is some
> way to determine the outer limits of an object
> (3d or whatever) including borders, since I
> felt it wouldnï¿½t be very strange if such a
> function existed.

For just getting the dimensions of an object including borders,
outlines, etc., use the following:

Save the object's current position and dimensions, then call
form_center() for this very object. You'll find the full width and
height of the object in the centered coordinates returned. Then use the
new position and dimensions of the object to calculate the x- and
y-offset. Now restore the saved position and dimensions of the object
and use the offsets and the width/height returned by form_center() to
calculate your clipping rectangle.

Example (written from memory):

```
/* tree: Pointer to object tree
* obj: Object number of object in question
*/

int16 x, y, w, h,
xoff, yoff,
ox, oy, ow, oh;

ox = tree[obj].ob_x;
oy = tree[obj].ob_y;
ow = tree[obj].ob_width;
oh = tree[obj].ob_height;

form_center(&tree[obj], &x, &y, &w, &h);
xoff = x - tree[obj].ob_x;
yoff = y - tree[obj].ob_y;

tree[obj].ob_x = ox;
tree[obj].ob_y = oy;
tree[obj].ob_width = ow;
tree[obj].ob_height = oh;

x = ox - xoff;
y = oy - yoff;
```

```
/* x, y, w, h now contains the full position and dimensions of
* tree[obj]
*/
```

Note: No guarantee ...

> However, if I could use the objc_sysvar,
> would it cause on older AES to crash, or
> would it just ignore it?

Neither nor. An AES without this function will display an alert "Illegal AES function" (or similar), but not crash. Of course, your program might crash afterwards if it uses the result of the call which actually doesn't exist. Therefore, appl_getinfo() exists to determine whether a certain feature is supported by the current AES.

Ciao

Thomas

If you want to update a specific object, then set the
clipping-rectangle to the rectangle retrieved from the window's
rectangle-list and do a objc_redraw() on the object you want to
redraw. There's no need to set the clipping-rectangle to the rectangle
of the object at all (unledd I've misunderstood your intentions).

Hmmm ... my onboard hard drive is in 4 partitions using ICD.
My outboard drive was completely reformatted using HDDriver
into six partitions:
16 Meg, 32 Meg, 200 Meg, 200 Meg, 36 Meg, and 36 Meg.

So the problem is my onboard drive causing fits for HDDriver?

>: And ... when I select "MIX" for the minix partition, the partition
>: disappears, even to minit.ttp!

>Like I said, you don't need to change the partition type to "MIX" (or

The documentation I was following (it has conveniently vanished)
was suggesting that the partition type should be designated MIX,
so I was trying to follow the instructions. If not necessary, so much
the better.

>This may be overkill, but I would suggest backing everything up (always a

You will almost certainly need the 'C Bible' next to you, Tony. It's
the 'C Programming Language' by its originators, Kernighan and
Ritchie. BUT ... this is no idiot guide - just a definition of
syntax/semantics.

When I was last looking on the library shelves I saw quite a number of
jokey, US, paperback tutorials. One of these should be easy to digest.

You could contain such objects within an I_BOX of their own and clip
to that instead. Okay, so it works but it's "annoying". ;-)

>I just thought I should ask if there is some
>way to determine the outer limits of an object
>(3d or whatever) including borders, since I
>felt it wouldnï¿½t be very strange if such a

Thomas's solution is the only way to accomplish this under all Gem
versions. It is in fact the method used by Pug (a front end used by
all my Gem applications).

You should note however, that the area returned by form_center() may not be exact. It will always be big enough to cause the object to be redrawn correctly but it may be larger - older Gem versions weren't too clever about it and included things like the shadowed feature even if it wasn't being used.

aha! I know there must be a way.
People saying things are impossible for whatever reason are often
proven to be wrong..

As far as overwriting anything a TSR would do, well maybe a TSR is not
the answer, but another trick is surely possible. As you can even run
STgames on a pc with emulation. so, anything is possible. At the
worst, emulating the hardware (joystick) via software, or whatever
way. it IS possible, just don't know how.
PPP on an atari ST? impossible.
WEB browsing impossible...
Realaudio on an atari? impossible.
mp2 songs on atari realtime? impossible...
etc etc etc. the list goes on.

Ah, but which? Are there 'classes' for instance? [see below]

>although theres a couple of add ons to do windows.. I
>have a djgpp setup that has the rsx extension to allow making windows
>programs but only with directX and full screen.. visualy no different
>than dos so back to that..

I'm not actually interested in DJGPP as such. It's just that I got an
email regarding 16-bit programs and "modes" under NT

The only solution I could provide is KB [who_gives_a_toss] where you
do the "full screen" command line thingy and run it from there. Plays
hell with *my* monitor thought. Just wondering if others found it
worked or not?

>>Btw, while I think about it ... what rez were they running in?

> Quite simple (at least it seems):

Famous last words. :)

> a TSR that would emulate a hardware JOYSTIK position from the keybrd
> cursor. A joystik is more a pain than anything, besides mine sucks.

I think what you ask for is neigh on impossible. :(A lot of games have their
own joystick handling code that accesses the hardware directly, overriding
any user patches.

However, as far as the hardware is concerned a joystick action is just like
pressing a key on the keyboard. If you are handy with a hex editor and/or
disassembler it is possible to hack individual games.

I don't have all the details to hand but basically the procedure is something
like;

Find the joystick code. Do this by searching for access to the keyboard
hardware by the program, if you have a disassembler this will be much easier,
if not then you'll need to convert the mnemonics into hex code and do the
search that way.

Once found, the code should take the following form:

```
if keypress = joystick_up then goto do_upwards
else
etc...
```

All you need to do then is change the value in joystick_up to the value of
the key you want to replace it with. You should be aware that the hardware
sends two codes for each keypress, one when you press it and another when you
release it. The release code is the same as the press code but with the high
bit set. The game program will take account of this and you need to be on the
look out for it.

All the hardware addresses and keyboard codes should be available from somewhere on the net, if you can't find them and you want them I'll e-mail
them to you.

John.

Not to me, considering that there is no reliable way to find out ! The OS can
"guess" based on the extension, that's all, but a *.PRG Extension does not mean
that it will call appl_init() and refrain from using the console.

Cheers Peter

Hi,

The Hitachi 6301V1 used in Atari computers is said to be compatible with
Motorola's 6800 micro-controller, so you can esaily get docs about this one.
In old French "ST-Magazine" (No 53 & 55) there are the opcodes of the 6301, how
they
work and how they are coded in hexa. It also explains how the chip handles
the keyboard. Most of instructions are 16bit long, and the available RAM is
128 bytes. I've got this doc, it will be hard to find time to type and
translate it, but if you need infos on some particular point, don't hesitate
to ask me :)
If you begin to work on it please e-mail me as I'm also interested in
a 6301 assembler/disassembler.

Vincent

2581. Editing RSC files

Newsgroup: comp.sys.atari.programmer
Date: 1998-11-27 00:00:00 UTC
From: derryck@TAKE.THIS.OUTcix.co.uk
Message-ID: <73mo7hapr5@plutonium.compulink.co.uk>
Source record: 3447

I'm experimenting with editing RSC files (with RSCView FWIW) with a view to changing/adding keyboard shortcuts to those programs that either don't have them, or use the ALT+key combo in menus where it's more common to use the CTRL+key.

Three immediate problems then, editing a menu string to remove the ALT symbol and replacing it with the carat used to indicate the CTRL key doesn't make the CTRL key take over as the modifier - can this done?

Secondly, how do I enter the "box" character from the keyboard to restore the symbol used to indicate the ALT key?

Thirdly, what about adding keyboard shortcuts to dialogs. I can see that ticking the "whitebak" box in RSCView underlines the first character and lo, this letter becomes the shortcut in conjunction with the ALT key, but how do I make another letter the shortcut (to avoid any clashes!)

I'm running MagiC 6 on a Falcon.

Thanks in advance from a non-programmer! :-))

: I'm experimenting with editing RSC files (with RSCView FWIW) with a view to
: changing/adding keyboard shortcuts to those programs that either don't have
: them, or use the ALT+key combo in menus where it's more common to use the
: CTRL+key.

Editting the resource file is not normally the way to add keyboard shortcuts.

: Three immediate problems then, editing a menu string to remove the ALT
: symbol and replacing it with the carat used to indicate the CTRL key doesn't
: make the CTRL key take over as the modifier - can this done?

Most programs do not check their resource file to see what their keyboard
shortcuts should be; keyboard shortcuts are usually hardcoded into the
program. (IMO, I think keyboard shortcuts should be taken from the
resource -- IIRC, Everest allows this to be done.)

Geneva allows something along the lines of what your want -- the user can
add keyboard shortcuts to the menu tree, and Geneva itself (rather than
the application) checks to see whether keypresses correspond to any of the
menu entries, and sends the aprropriate menu message to the application.

You may be able to fake things using keyboard macros.

: Secondly, how do I enter the "box" character from the keyboard to restore the
: symbol used to indicate the ALT key?

You should be able to type in the appropriate ASCII code using ALT and
the keypad; if you don't have an Atari ASCII table handy, just go by
trial and error, since the ASCII code is not very high. I.e., type in
ALT-000, then ALT-001, and so on.

: Thirdly, what about adding keyboard shortcuts to dialogs. I can see that
: ticking the "whitebak" box in RSCView underlines the first character and lo,
: this letter becomes the shortcut in conjunction with the ALT key, but how do
: I make another letter the shortcut (to avoid any clashes!)

I think the standard way of doing this is to put a [in front of the
character that you want to be the shortcut. Geneva, at least, allows this.

Keyboard shortcuts are (usually) built into the program and unless
there's a feature of the program to change them (as in Connect),
you're stuck with what's there.

>Secondly, how do I enter the "box" character from the keyboard to restore the

This is probably a feature of Magic. Let'm'Fly does the same thing,
with the ALT shortcuts being assigned alphabetically, if I recall.

I thought that this would be the case - however the HYP that accompanies
RSCView suggests that this can be done (alter menu shortcuts).

>Most programs do not check their resource file to see what their keyboard
>shortcuts should be; keyboard shortcuts are usually hardcoded into the
>program. (IMO, I think keyboard shortcuts should be taken from the

This might be the type of program that the HYP is referring to, I'm
experimenting with Personal Finance Manager Plus, quite an elderly program
but one that definitely benefits from keyboard operation.

>Geneva allows something along the lines of what your want -- the user can
>add keyboard shortcuts to the menu tree, and Geneva itself (rather than

That sounds like a worthwhile plus.

>You may be able to fake things using keyboard macros.

I can't see a way of doing that ATM.

>: Secondly, how do I enter the "box" character from the keyboard to restore the
>You should be able to type in the appropriate ASCII code using ALT and
>the keypad; if you don't have an Atari ASCII table handy, just go by

This doesn't work (I'd already tried it), all you get is the string of
numbers entered in the input field. However it's possible to use CTRL C and
V in turn to copy and paste if necessary.

>: Thirdly, what about adding keyboard shortcuts to dialogs. I can see that
>I think the standard way of doing this is to put a [in front of the

2588. Changing the window INFO line

Newsgroup: comp.sys.atari.programmer
Date: 1998-11-29 00:00:00 UTC
From: rosco@game-master.com
Message-ID: <36611cd4dba0f0@game-master.com>
Source record: 3454

A few months ago there was a discussion here about how to change the contents of an AES window info line. At the moment I'm using this (in GFA Basic):

```
adr_info%=V:info$
~WIND_SET(handle,3,CARD(SWAP(adr_info%)),CARD(adr_info%),0,0)
```

and when the info contents are changed, I get garbage characters at the end of the INFO line as well as the TITLE line of another window.

How can I change the INFO line cleanly?

The strings have to be null terminated like so:

info$=info$+chr$(0)

Sounds like your string isn't nul terminated! All strings used by the operating system are C strings - you have to ensure the byte after the last character is '\0' (ie chr$(0)).

Date: 1998-11-30 00:00:00 UTC
From: Theo Ros <theo.ros@rnw.nl>
Message-ID: <01be1c3f$ea11b920$c0cb3a91@default.rnw.nl>
Source record: 3458

```
Not only should your string be NULL-terminated, also it's better NOT to
store it in a string, because they get shifted around a lot in memory:

* Use a numeric array:
DIM wintitle|(SUCC(LEN(info$))
adr_info%=V:wintitle|(0) ! OPTION BASE 0 !!!
* or a MALLOCed piece of memory:
adr_info%=MALLOC(SUCC(LEN(info$))
* or an INLINE:
INLINE adr_info%,amount_of_memory_needed

The string can now be written to this memory with the CHAR{} command, which
automatically adds the terminating null-byte:
CHAR{adr_info%}=info$

now you can safely update/set your infoline with

~WIND_SET(handle,3,CARD(SWAP(adr_info%)),CARD(adr_info%),0,0)

the same rule applies for window titles.

Greetz,

What do you want to do with it? If you want to make GEM-stuff, then
get "Professional GEM" by Tim Ohren, it's available on every Atari
ftp-site. (And soon on www-atari.nvg.ntnu.no/programming/)

If you want to make games... Well, you don't need any C-specific stuff
then, any hardware-reference will do. But it helps to know assembly
;-) ST-News had some excellent articles about this almost ten years
ago, you can find lot of useful info there.

Hello everybody,

I just installed the gcc-2.8.1.c and got trouble with the linker now,
which reports a lot of Symbols defined in more than one modul. But
these are all inline functions frome class definitions and so they
shouldn't be found in the modules. Have I forgotten some compiler
switches or is the linker buggy?
Two switches I found myself: -fno-rtti and -fno-exceptions, to avoid
errors about missing symbols '__rtti' and '___throw'.

Thanks, Ralph

The WHITEBAK turns it on as you've discovered. In order to specify
which key you need to place its offset into the high byte of
ob_state thus ...

```
ob[obi].ob_state |= ((pos << 8) | WHITEBAK);
```

... where 'pos' denoted where the underline is, offset from zero.

> key doesn't make the CTRL key take over as the modifier - can this
> done?

Simple answer no. :(Short cuts such as these have to be hard coded into the
actual source of the program. I don't think there is any simple solution
except to ask the original programmer to change it.

> Secondly, how do I enter the "box" character from the keyboard to
> restore the
> symbol used to indicate the ALT key?

It'll by CTRL+somekey, experiment!

> Thirdly, what about adding keyboard shortcuts to dialogs. I can see
> that ticking the "whitebak" box in RSCView underlines the first
> character and lo, this letter becomes the shortcut in conjunction with
> the ALT key, but how do I make another letter the shortcut (to avoid
> any clashes!)

This is purely a feature of the Magic OS, and will not work under normal TOS.
Unless it is coded into the software directly.

I'm not sure of the answer to this, but if you look at the resource file with
an old editor such as ORCS, you'll see that the underlined letter is always
preceded by a '['. It could be worth a try.

John.

I know a problem with the old Gas 1.9, you can try option -O1 to pass the
problemor change of version of Gas, there is a good one number 2.8 I
think, I'm sure it could resolve your problems.

Hi all,

I am trying to get to grips with GEM programming but I am finding
it quite difficult. I am currently using Hisoft Basic and the
excellent Enchant libraries which is making a good part of programming
for GEM easier, but I am still finding that I do not know enough
about GEM as I would like.

Can anybody suggest some good WEB sites, or books that explain how to
program for GEM (not necessarily for Basic) and which contain examples
and downloadable source code?

Thanks.

Regards,

Ben Hills.

But not the only one. With any Basic, whenever you change the contents of
a string, the Basic is allowed to use a different spot in memory, so the
actual address of the string changes. Thus you need to do that wind_set
call each time the string is changed (maybe you do so, but it sounded as
if not).

Cheers Peter

Aha! That's a great help - I can now adjust the position of the underline
and hence the keyboard shortcut. About the only tweak I didn't make, so
thanks! :-)

A limited success story with Personal Finance Manager Plus tho', the
underline and the ability to use the shortcut disappear after you've used it
and doesn't reappear until the next program load - wierd! :-(

d> Three immediate problems then, editing a menu string to remove the
d> ALT symbol and replacing it with the carat used to indicate the CTRL
d> key doesn't make the CTRL key take over as the modifier - can this
d> done?

I know very little about programming but I have translated a number of RSC
files as you know, and got some experience re your problem. The thing is that
some programs read the shortcut directly from the menu entry in the RSC
file but others (?most) don't - they are hardcoded in the PRG file (I think).
Sometimes this can be changed if you can find the correct spot :-(

d> Secondly, how do I enter the "box" character from the keyboard to
d> restore the symbol used to indicate the ALT key?

Use Alt+007 (number-pad) in the usual way; this works in RSCView (have
checked).

d> Thirdly, what about adding keyboard shortcuts to dialogs. I can see
d> that ticking the "whitebak" box in RSCView underlines the first
d> character and lo, this letter becomes the shortcut in conjunction
d> with the ALT key, but how do I make another letter the shortcut (to
d> avoid any clashes!)

In some programs (e.g. Thing) this is done by setting the ob-state extended
flags '8' to '14' (those under the second column in RSCView) counting in
binary mode, with the text string position starting from 0; thus no flag set
will underline the first character of the string (i.e. position 0) and use
this for the shortcut, the first flag ('8') set underlines the second char.,
the second flag ('9') the third char., both '8' and '9' the fourth, '10' the
5th, '8' and '10' the sixth etc.; '15' should not be touched as it has some
special function, and all from '8' to '15' set means don't use a shortcut for
that entry.

Other resourse files have an opening square bracket '[' in front of the
relevant letter and I have also seen other symbols used for this -again it
depends on how the programme is coded (may have something to do with the
compiler used).

Regards
/Peter/

Yes, that seems to be the concensus. It's a shortcut on the programmer's
part because having a redifinable version makes multilanguage support much
easier.

>Sometimes this can be changed if you can find the correct spot :-(

:-((

Yep, this works but only under single TOS it seems. There's a couple of bugs
that I'll need to email Holger about.

> d> Thirdly, what about adding keyboard shortcuts to dialogs. I can see

As he said, it's a C and C++ compiler, more widely known as GCC.
Needless to say, there are lots of GCC versions available for the Atari,
so there's no need to switch to another compiler. Some of the others
may be easier to use thanks to IDEs, but GCC beats them all when it
comes to optimization and code generation.

>I'm not actually interested in DJGPP as such. It's just that I got an

Hello everyone!

I have the following atari Compute's books for sale:

"Compute's first book of atari graphics"

"Compute's second book of atari graphics"

"Compute's first book of atari games"

"Mapping the Atari, 1st edition"

All of the books are in good condition and are priced at $10.00 each
plus shipping. I would suggest the 3 day shipping as it is only $3.00
and gets the books to you quickly at a reasonable price. Please e-mail
me if you are interested in any of these. Thanks!!

Rather perversely, hard coding keyboard shortcuts is one of those situations where you end up with a big if/then/else construct, or similar. Not only is this an indication a better method ought to be sought, it involves more effort than doing something generic!

The menubar is easy: walk tree, locate shortcut, issue self equivilent MN_SELECTED message!

Ah, sounds like they've screwed up. Part of the specification of the
Gem design was that things it doesn't understand ought to be ignored.
Moreover it ought to be preserved. They've most likely set the whole
of ob_state to some value rather than using masking to manipulate just
the bitfields which were "understood" at the time.

Curing this would involve hacking the executable. :-(

Hi

I've just got my hands on a Pioneer DRM-624X a 6 x CD-ROM changer. It's a SCSI device and uses LUN numbers from 0-6. E.G.. Drive ID=5 lun=0, drive ID=5 lun=1 etc...

How do I get Extendos (v2.4) to enable me to use this drive fully; or is there another package for the Atari ST that would do the job?

Any help will be more than appreciated.

--
Cheers! for now

Sometimes, resource editors allows you to type a "Control-G" in a text entry line in a dialog to get the "Alternate" character.

Some explanations and example can be find
here:http://www-air.inria.fr/People/bereziat/gem.html

But it's in french, examples are in C.

You can use Mesa, it's a very good OpenGL like, all sources are
avaiblehttp://www.ssec.wisc.edu/~brianp/home.html

For real time it's a little bit hard if you have not an Hades60.

I port it for Atari like dynamic library and it can be use for PureC and
GCC for the moment
and it's not to hard to port it on other language. but it's in french!

Read the documentation. Each LUN becomes one drive letter, so you would have
D:, E:, F:, G:, H:, and I:. It's a simple configuration ASCII file.

```
Web site udpating:
------------------

After technical problem with our accommodation, our web site was broken.
Actually, he is running correctly with many modifications in bonus.

- a page with french and foreigners distributors.
- a page with various links wich claims to grow...
- a quick access to tested softwares on CENTurbo II (163 refenrences).
- a CT2 FAQ in the softwares page of CENTurbo II menu.
- new version of CBOOT 1.0.8, PUTFLASH 1.0.8 + FLASH.BIN 1.0.2,
CENTscreen 3.4.0, VIDEOMOD 1.2.0. All from 12/08/1998.
- new version of CENTview 2.9.0 from 11/25/1998.
- new version of CECILE Demo 1.84 form 11/10/1998.
- new version of SANDRINE Demo 3.0 from 05/11/1998 that you can use to really
scan but with colorless :-)

CENTurbo II: Available in January 1999
------------

The CENTurbo II revision B is in productions. She will have a new hand-made
Fast-Ram controller (same on the Phenix) and more quickly.

A better integration permited to decrease the price to 1890FF TTC !

The serie will be limited, contact your resellers...

Phenix:
-------

The prototype is routing phase according to the last implantation (see Phenix
page).

We finish the USB and PCI validation at the moment (hardware and software!).

The DSP+20-bit audio part is valid.

Thanks for your attention.

If you don't mind, please send it to the above email adress. Does the
program also operate on other (OverScan) resolutions ? If not, i would still
be very interested in the program. How much CPU time does your program take ?
Or is it ajustable ? have you used the HSYNC of the MFP, or the HSYNC of the
MC68k ? I have a manual for the Line-A, but I was wondering if anyone had
some more experience with tweeking the LineA.

the package you have can handle it, as can the new Extendos Gold.
In Extendos Gold they also have an installer that has screens for
you to set up the multi changers - but I don't think this existed
in the older version. Wayne

2627. MIDI & 16Mhz

Newsgroup: comp.sys.atari.programmer
Date: 1998-12-14 00:00:00 UTC
From: rosco@game-master.com
Message-ID: <3675971a102cd10@game-master.com>
Source record: 3493

I'm writing a MIDI librarian program in GFA Basic. The code works fine in the interpreter, but the compiled code seems to be having problems with the MIDI data and I get a lot of glitches.

However, if I switch to 8Mhz (from 16Mhz on MegaSTE), the compiled code behaves itself.

Any ideas what I can do to correct this? Would it be acceptable to have my program switch the computer to 8Mhz?

I tried putting a 1/5 second pause in the code. This helped, but not 100%.

It will not work, because the OS are different. The best you can do is
re-write the code in GW-Basic or whatever BASIC that runs on PCs. If your
program uses GEM, it will be very hard !
good luck !

Vincent

PS : another solution is to get an ATARI ST emulator like PaCifiST and run
the GFA Basic from it :)

Hi

Do you use BIOS calls Bcostat, Bconstat, Bconin and Bconout or do you directly access the Midi ACIA registers ?
If you use BIOS calls, I don't see any reason why it shouldn't work, but if you use direct access to the MIDI registers, you might have forgotten to wait for the ACIA to be ready to give you or send a byte.
(bits 0 and 1 of $fffc04).

I've written similar stuff in assembly langage and it works perfectly at 16MHz I hook the IKBD midisys vector and directly access the hardware, but when I switch to 8Mhz it doesn't work correctly anymore if I have to get too many MIDI messages at the same time. I suspect the overhead of the midisys vector to be too long but if it's not the case it might fail for the same reason as your program does.

It's not a good idea to switch the computer to 8Mhz because if you want your program to run with MiNT, it should respect others applications ! And anyway it is to the software to accept the hardware.

Vincent

I've been using all these BIOS calls except Bcostat (check output
status). It hadn't occurred to me that I might need this, because the
MIDI buffer is cleared before any new transmission.

I'll try incorporating this call.

You would have to a pretty complete conversion to go to GFA for PC.
Another choice is try power basic. I converted a lot of GFA atari
programs and it was not too bad, although you still have to work
on a PC. Power basic also has 32 bit code and will work with W95/98

2635. fopen_env

Newsgroup: comp.sys.atari.programmer
Date: 1998-12-16 00:00:00 UTC
From: kma54@csc.canterbury.ac.nz
Message-ID: <fnXVCxuPCb5S@cantva.canterbury.ac.nz>
Source record: 3352

Greetings all,

I started working on some resusable software components for future projects [read as: some handy routines to make coding life more tolerable], and the first thing that came to mind was a function to make locating say, a configuration file, easier.

What I've noticed in recent months, is that modern Atari apps tend to read/save *.CFG and *.INF files to $HOME\DEFAULTS\ or $HOME\ directories.

Take for example the text editor qed (taken from the docs),
> qed looks for the parameterfiles qed.cfg, pdlg.qed, display info
> file and the resource file qed.rsc on several paths.
>
> The search order for parameterfiles is:
> (1) in the path of the envariable $QED
> (2) in the path of the envariable $HOME
> (3) in the path $HOME/defaults
> (4) in the path that qed was started from
> (5) in the current directory.

[...]

The function I've written - fopen_env, extends the standard library function fopen (which does the hard work), and searchs multiple paths for a specified file. If found, a file pointer is returned, else NULL.

It has one extra argument over fopen - init_envpath, which is the initial environment path to search in. Such as, $PATH or $QED etc. Set this to NULL if this isn't required.

The comments should adequatly explan other details...

This took me a while to write (a week!), 'cause I had to learn a few more tricks with pointers - a lot of reading was needed and scanning though other peoples code, but I feel much wiser now ;-)
(thanks to the likes of Dominique Bereiat and Anthony Jacques for freely providing their source code to anyone nosy enough to look through it!)

BTW, I hope this posting isn't too long, if I receive complaints, then er um... I won't do it again! ;-)

```

(1)
Although this (apparently*) works it probably isn't doing what you think - SEPARATOR does not go out of scope on the closing brace for the 'if'. Use ...

```
const char *SEPARATOR = " ,;";
```

... which will.

(*)
Looks like the Lattice preprocessor is broken - statements which do not commence in the leftmost column should be ignored.

It is worth noting that the preprocessor has got nothing to do with a C compiler (aside from the fact there always is one), a fact easy to miss in an integrated development environment. The preprocessor is little more than a text substitution program which runs in its

entirety before the compiler itself even *sees* the code. This means that every time you use SEPARATOR the preprocessor replaces it with " ,;" - the compiler never knows SEPARATOR or any other macro ever existed! Try this ...

```
#define blah(x,y,z) (((x) < (y)) && ((x) > (z)))

main()
{int x =0;

blah(x++,1,2);
}
```

The reason 'x' has a value of 2 (and a hidden intermediate value of 1) is because the preprocessor changed the source code which the compiler subsequently sees to this ...

```
main()
{int x =0;

(((x++) < (y)) && ((x++) > (z)))
/* ie (((0++) < (y)) && ((1++) > (z))) */
}
```

and the comment shows another side effect, something which provoked many compiler vendors to replace the standard ctype.h with one which uses functions.

Yes. All those parentheses are necessary to prevent some really bizarre compiler errors. If ever you are *certain* there's nothing wrong with the syntax of your source code then go check no preprocessor stuff is involved! ;-)

(2)
'static' isn't needed here, simply ...

```
char *fconf(const char *, const char *);
```

... will do, and the (char*) cast each time you call fconv() is not required either - the compiler knows from the above declaration. Try hard not to get into situations where you need to cast things a lot. Doing so may force the compiler to be quiet about errors it would otherwise have moaned about.

(3)
Older MagiC versions did not have a U: drive so you'll have to check the version. I don't know much about U: (or MiNT) myself but I suspect there might be a better way. Maybe Pdomain() might solve the MagiC and MiNT tests in one, or perhaps just testing the existence of U: might do?

(4)
You *might* want to tag on a look using the current Tos path Dgetdrv(),Dgetpath(). The AES in old Gem versions isn't too clever and

this may save a search from failing. The relevence of doing this
depends on how much reliance your app has on using the AES functions
used here, elsewhere.

```
>/*--------------------------------------------------------------------*
> * Internal function; used to configure "filename" to "path" *
> *--------------------------------------------------------------------*/
>
>static char *
>fconf( const char *path, const char *filename )
>{
> static char buf[FMSIZE];
/*(5)*/
> /* if a path is given, configure it so that it's suitable to use.
> * i.e, if no drive specified, then assume "U:" (MiNT/MagiC).
> */
> if (path) {
> if (*path == '\\' && (use_u_drive = YES)) {

> */
> if (filename)
> strcat(buf, filename);
>
> /* return "drive:\path\filename".
> */
> return (buf);
>}
```

(5)
How big is FMSIZE? As it comes from dos.h (which I assume is part of
Lattice) then it might be as small as 64. Using 128 is a reasonable
size but ideally 'buf' still needs checking for overflow. If you've
got to go to this trouble you might as well not bother checking at all
and just get enough space to start with ...

```
#define Wibble(s) ((s) ? strlen(s) : 0)

char *buf =malloc(Wibble(path) + Wibble(filename) + 3 + 1);
```

which is enough space for both strings, the three characters that
might get inserted and a trailing nul. You will have to free() these
strings when you've done with them of course.

```
>/*--------------------------------------------------------------------*/
>/* rm this stuff below; just a little test. */
>int
>main( void )
>{
> FILE *fp;
>
> if (fp = fopen_env("PATH", "PROFILE.MUP", "r"))

2639. Netscape Gecko

Newsgroup: comp.sys.atari.programmer
Date: 1998-12-20 00:00:00 UTC
From: Joakim H&#65533;gberg <fiolerna@al_ALBATROSS_gonet.se>
Message-ID: <367C57BA.3AC0@al_ALBATROSS_gonet.se>
Source record: 3356

Greetings Atarians!

Rumours has told me that Netscape has released an alpha-version of their new browser kernel, Gecko. Gecko is said to be included in all new releases, and will take a modular approach to making things work. It is said to become fast and small and the source code is free...

Now, would it be possible (and useable) to make an atari-port from this thing, when it has gone past the alpha- and beta-time..?

Just a thought..

Regards,

Joakim

Hello folks!
I started program my Falcon in C. But it is no fun at all.
I use an old version of TURBO C, which doesnï¿½t support any new
OS-features (as fsel_ex).
Iï¿½ve downloaded GNU C 2.72, but I can manage to work with it.
What is the best C-Compiler for the Falcon (supporting 030 and FPU)?
Is there an experienced GNU C user on this group?

I've never managed to do anything with GNU C, I needed MiNT just
to get it running. I know there is a G.U.I. shell available. Otherwise, you
can try to get hold of Lattice C from HiSoft, (what I use, is it still
available ?) or there's Pure C, about which I now nothing at all. I
suppose the easiest to install public domain compiler is Sozobon C, if
anyone still uses it. At least Lattice came with loads of docs. At the
last Uk Atari show someone was selling a whole load of Prospero development
kits, that included Prospero C. Does anyone know what became of them ? That
compiler wound up on a magazine cover disk, but I was never too happy with
the GEM bindings. The big two comercial offerings are Lattice and Pure C.

There's a fair bit on C in the ICTARI disk-zines. I'd prefer to
call ICTARI "just resting" rather than dead, but I haven't seen a
contribution in over a year. Perhaps when I don't have a PhD to finish, or
when I want a distraction, I *might* try for a re-launch.

In the meantime: http://www.elis.demon.co.uk/ictari/ictari.htm
or get all the issues on the Mark Wherry/Atari Computing "Renegade" CD.

Have Fun,
"Augeas"
(Who has FORTRAN to write...)

Looking back on it, I don't know why I didn't place it in the header
file or at the top; under the #includes. I think you're probably right,
for some strange crazy reason I must have been thinking about its scope.

So do you consider the use of
>
> const char *separator = " ,;";

to be a better method in this situation?

> (*)
> Looks like the Lattice preprocessor is broken - statements which do
> not commence in the leftmost column should be ignored.

There maybe a switch in Lattice for this, its preprocessor has a few
options to choose from. Such as, allowing nested comments. Time to
browse the manual again ;-) I think there was an option for strict
ANSI; that may do it.

> Yes. All those parentheses are necessary to prevent some really
> bizarre compiler errors. If ever you are *certain* there's nothing

A good hint eh! Yeah, I'll keep this in mind ;-)

> (2)

The reason I had it as a static function was because I (currently at
least) haven't got a use for it other than as a supporting function for
fenv_env().

> ... will do, and the (char*) cast each time you call fconv() is not
> required either - the compiler knows from the above declaration. Try

er.. funny you should say what 'cause Lattice *did* give me these nice
little warnings. (I'm reaching for the manual now ;-)

> (3)
> Older MagiC versions did not have a U: drive so you'll have to check
> the version.

Shit, didn't know that! Damn, well I do know that version 4.xx and up
has one. What's the likelihood of someone still using an older release I
wonder?

Well, that's another couple of options I guess. Time to do some more
reading me thinks ;-)

Yep, I'll add this.

It's defined as 128, so it should be ok.

oooh, handy! I'll remember this :-)

Well thanks for your comments Guy.

Later,
Karl.

PS. Wibble?? Well, it makes a change from seeing "foo" or "bar" I guess
;-)

Ah this takes me back, one of my favourite 8-bit games!

I haven't come across it on cartridge, or even heard of it being
available on cartridge.

Drop me an email with the subject being 'WANTED: M.U.L.E. On cartridge'
to asx@steverosie.demon.co.uk and I'll see if I can track it down
(that's if it was on cart.)

Me too please.. email to
bpenrice@netcomuk.co.uk
when you have the time.

Just out of interest, will it do 320x400 and 640x400 on a colour
monitor? :) Or higher, if combined with a demo utilising overscan?

An afterthought:
Also.. just as 320x200 can be made to display 512 colours in a limited fashion, or even 4096 on a STANDARD ST (or 19200+ on STe), any way of increasing colours in medium res -- or even introducing some greyscale to high res mode? Even just four greys. 16 colours in medium res + 240-line overscan + your interlace program + a flicker-reducing filter = a passable VGA resolution display..! Might be nice to experiment with that.

Has anyone managed to get the Lattice C IDE and Geneva to coexist happily? Specifically, when running CLINK from the IDE under Geneva, CLINK fails with error 426. It works under SingleTOS, and the problem definitely occurs only when Geneva is active.

Are there program flags in Geneva I can set to avoid this problem?

Or am I "stuck with" the command line tools? Is there another graphical shell with which I can replace the Lattice IDE? If not, what command shell runs well under Geneva, and works like the Bourne shell?

It isn't too difficult to add missing functions to a C compiler if
you're prepared to devote some time to the task. I have kept Mark
Williams C up to date for instance.

Such is life. As is the fact I've already replied to this. Trouble is
I don't know if it got sent and hasn't appeared yet, or just got lost,
so here I go again. This is an excellent opportunity for me to
contradict myself! <G>

>
>So do you consider the use of
>>
>> const char *separator = " ,;";
>
>to be a better method in this situation?

The short answer is yes. It comes into scope only when needed and the
compiler has more information so we can't accidentally modify it.

```
/* useless but revealing example */
/* ie string literals can be modified */
main()
{
"fred"[1] = 'w';
```

```
}
```

A full explanation is quite involved. It requires consideration of
both the storage class used and where items come in and out of scope.
These factors can mostly be ignored. They become relevent mostly when
attempting to optimise code for increased speed. There is a code size
factor as well but you'd have to go to extremes in order to start
worrying about that particular issue.

```
>> (*)
>> Looks like the Lattice preprocessor is broken - statements which do
>> not commence in the leftmost column should be ignored.
>
>There maybe a switch in Lattice for this, its preprocessor has a few
>options to choose from. Such as, allowing nested comments. Time to
>browse the manual again ;-) I think there was an option for strict
>ANSI; that may do it.
```

It doesn't actually matter. It's the knowing that counts.

```

>> char *fconf(const char *, const char *);
>>
>The reason I had it as a static function was because I (currently at
>least) haven't got a use for it other than as a supporting function for
>fenv_env().
```

Imo that's a good habit to adopt. Hide everything you can! For larger
projects I'll even wrap up data inside an access function.

Example:

```
char*
GL_RSCNAME(bool f, char *s)
{static char *rscname =NULL;

if (f) {
memkill(&rscname); /* wrapper for free() */
/* doesn't barf on NULL */
/* and sets rscname=NULL */
rscname = strdup(s);
/* possible NULL check/debug code here */
}
return rscname;
```

}

The header file would contain ...

#define GetRscName() GL_RSCNAME(false)
#define SetRscName(s) GL_RSCNAME(true,s)
char* GL_RSCNAME();

Btw, the above is K&R - it'll need modifying a tad for ANSI. A
slightly more advanced one could see if the new string was shorter
than the current one. That would save freeing and reallocating.

>> ... will do, and the (char*) cast each time you call fconv() is not

Not much. The version (and a lot of other things) is contained in the
MagiC OS header. I might be able to dig out some code for
interrogating the MagiC header block if you want?

>
>It's defined as 128, so it should be ok.

Newer code I've written has no real limit but the older stuff upon
which it rests does, and that happens to be 128. I've never had a
problem with that value myself. :-)

>>
>> #define Wibble(s) ((s) ? strlen(s) : 0)
>>
>> char *buf =malloc(Wibble(path) + Wibble(filename) + 3 + 1);
>>
>> which is enough space for both strings, the three characters that
>> might get inserted and a trailing nul. You will have to free() these
>> strings when you've done with them of course.
>>
>oooh, handy! I'll remember this :-)

Here's a wrapper for free() (pun not intended!)

```
void
memkill(void **p)
{
if (NULL == *p) return;
if (!notmem(*p)) free(*p);
*p = NULL;
}
```

Call it thus ...

```
main()
{char *p =strdup("Hello World");

memkill(&p);
}
```

That way it doesn't matter if strdup() fails. It comes in most handy
when a function making heavy use of malloc etc barfs half way through
because it can just use section of code which memkills all the
pointers, rather than having to check them all individually.
Additionally it helps in finding memory leaks. By setting the pointer
to NULL it'll cause a bus error if the caller attempts to use it,
rather than allowing the code to scribble in deallocated memory.

Incidentally, notmem() is specific to my (MWC) compiler. See if
Lattice has an equivilent. It interrogates the "arena" (ie list of

allocated memory held by the C memory manager) and tells if the
pointer came from there or not. This allows me to memkill all sorts of
pointers without bothering to check where they came from. Eg:

```
main()
{char *p =strdup("Hello"),
*s ="World";

memkill(&p);
memkill(&s);
}
```

Oh, just remembered - you'll need a macro round memkill to prevent
Anso moaning.

```
#define MemKill(x) memkill((void**)(x))
```

should do the trick.

>Well thanks for your comments Guy.
>
>Later,
>Karl.

2662. Elysium updated...

Newsgroup: comp.sys.atari.programmer
Date: 1998-12-29 00:00:00 UTC
From: ashley.seabrook@zetnet.co.uk
Message-ID: <76amjfprg3@irk.zetnet.co.uk>
Source record: 3379

And about time too ;-)

I've revamped the site, juggled the Atari & TOS pages around a bit and updated the links - adding 177 new ones in the process. There's hopefully more to come fairly soon, and just in case any Atarians are into goth music, some Fields of the Nephilim pages are on the way...

Finally, there's an alias avaliable for the Atari & TOS pages - elysium.atari.org

Happy New Year!

Ashley

Ashley Seabrook, webweaver at Elysium:

2663. Difference between Dreaddir and Dxreaddir

Newsgroup: comp.sys.atari.programmer
Date: 1998-12-29 00:00:00 UTC
From: gary@the-gap.demon.co.uk
Message-ID: <3688d01a2436850@the-gap.demon.co.uk>
Source record: 3380

Does anyone know what the difference between MagiC's Dxreaddir and MiNT's Dreaddir is? And does MagiC support Dreaddir as well as Dxreaddir or instead of?

Dxreaddir seems to have an extra parameter 'xr' but my German isn't good enough to work out what it is. :(

Basically, I'm trying to add longfilename support into one of my programs, and want it to work with both MagiC and MiNT (as well as single TOS though obviously that will still use Fsnext etc.)

Also, when using Dxreaddir or Dreaddir, is there anyway to get it to do wild card matching like Fsfirst does (ie. Fsnext *.doc will just return .doc files), or do I have to read each file entry and do my own wild card matching?

TIA,
Gary

> of?

Both MiNT and MagiC have Dreaddir() and Dxreaddir(), but you can't rely
on Dxreaddir() being available, so check for EINVFN as the return code
and fall back to Dreaddir() + Fxattr() in this case.

Which leads to what the extra parameters for Dxreaddir are: The first,
xr, points to an XATTR-structure which will be filled with the same
values as if you had called Fxattr(1, ...) (i.e., symbolic links won't
be dereferenced) with the new file. The second extra parameter, xret,
points to a long which will contain the return value of the internal
Fxattr()-operation (thus, it is possible that Dxreaddir() itself was
successful, but the internal Fxattr() failed).

Note that you only need Dxreaddir() if you also need more information
than just the name of the file(s). The reason for its existance is that
it's alot faster than having to call Dreaddir() and Fxattr() separately.

> Basically, I'm trying to add longfilename support into one of my programs,
> and want it to work with both MagiC and MiNT (as well as single TOS
> though obviously that will still use Fsnext etc.)

Well, as long as only GEMDOS calls are concerned, there's no need at all
to directly check for MagiC or MiNT for long filename support, since all
non-existing calls will simply return EINVFN (-32L).

> Also, when using Dxreaddir or Dreaddir, is there anyway to get it to do wild
> card matching like Fsfirst does (ie. Fsnext *.doc will just return .doc
> files), or do I have to read each file entry and do my own wild card
> matching?

The latter, but there's a very nice pattern matching function available
(by Rich Salz, IIRC). It needs some fixes, but it's small and reliable.
If there's interest, I'll post my modified version here.

Ciao

Thomas

Hi Gary!

GP>Does anyone know what the difference between MagiC's Dxreaddir and
GP>MiNT's Dreaddir is?
Dxreaddir(); is a faster repalcement for doing Dreaddir(); Fxattr();

GP>And does MagiC support Dreaddir as well as Dxreaddir or instead of?
MagiC supports both calls since 3.0 and AFAIK MiNT supports both calls too

GP>Dxreaddir seems to have an extra parameter 'xr' but my German isn't
GP>good enough to work out what it is. :(
The Fxattr() part of the call can fail although the file name was readable so
you get an additional return code for the Fxattr() part. This return code is
placed in the long the parameter xr is poining to

GP>is there anyway to get it to do wild card matching like Fsfirst
GP>does (ie. Fsnext *.doc will just return .doc files), or do I have to
GP>read each file entry and do my own wild card matching?
You will have to do your own matching (which can be much more powerful than
TOS' buggy matching)

Bye

Joerg

2666. REQUEST: I need an Atari Fuji symbol

Newsgroup: comp.sys.atari.programmer
Date: 1998-12-31 00:00:00 UTC
From: onlyinohio@aol.comN0spAM
Message-ID: <19981231090807.12603.00004436@ng-cr1.aol.com>
Source record: 3383

Hi there:

I grew up using Atari 400/800 computers. Now that I'm using a PC with Win95 I would like either a screen saver with a rotating Atari Fuji symbol or a large 3D Fuji symbol to use as the opening screen instead of the clouds when Win95 loads. Does anyone know where I can find either of these?

I remember some really neat demos of 3D Fuji's that rotated while the color bars changed color. Can't believe that somebody hasn't ported them over to the PC.

Any help appreciated. Remove the "nospam" to reply. Thanks. Karen

2667. Lattice C and Geneva

Newsgroup: comp.sys.atari.programmer
Date: 1999-01-01 00:00:00 UTC
From: cv436@torfree.net
Message-ID: <F4wnrJ.qK.0.queen@torfree.net>
Source record: 3384

Under Geneva you can set certain badly behaved programs as Single Tasking
so that all other programs go to sleep while the one program executes.
It's a dialog accessable under the Task Manager accessory.

A CLI that works under Geneva is the NEODESK CLI which requires NEODESK too.

Later...

2668. Keyboard shortcuts

Newsgroup: comp.sys.atari.programmer
Date: 1999-01-01 00:00:00 UTC
From: PWest@thedruid.demon.co.Remove.To.Reply.uk
Message-ID: <+by3gDAeCTj2EwPg@thedruid.demon.co.uk>
Source record: 3385

Hi all!

A short time ago there was discussion here after a posting from Derryck about altering keyboard shortcuts with RSCView or RCS editors. I have now had a long discussion about this with Holger Weets (well-known German author of ST-Guide, Finder, RSCView and many other fine progs) and some of the points he made may be of wider interest (though exprienced programmers will no doubt know them):

Menu shortcuts: He says that quite a few modern programs can read the shortcuts directly from the RSC file (or RSC portion of the PRG file if there is no separate RSC) so they are easily changed during translations if necessary. However, the original programmer has to write code in a way that implements this - Holger does not know of any library that does this automatically.

Note however that some programs use the Scancode rather than the ASCII value to evaluate the key pressed, and this may give problems with keyboards having a different layout from that used by the programmer (such as the swapped Y and Z of German/English&US keyboards, the Umlauts etc).

But on many programs the shortcuts are not in the RSC portion but hard-coded elsewhere; these can only be changed with a disk monitor -- if one can find them!

Dialog shortcuts: Many (?older?) RSCs use a '[' in front of the letter that is to serve as a shortcut when pressed together with ALT. This is a feature of some GEM libraries and so will only work if the programmer has used one of these.

The alternative of using the Whiteback flag to activate the shortcuts together with ob_state flag(s) to specify the position of the underlined character in the string was originated by MagiC, but also works when running under TOS if the programmer has written the code to make use of this feature; when running under MagiC (but not TOS) one can also update old programs that do not have this code to use this shortcut method as long as their dialogs are displayed/evaluated by the system.

Hope this is of some interest!

Happy New Year to you all

Regards
/Peter/

As an ongoing attempt at improving my C coding style and approach I though I would have a bash at writing some code in Lattice which uses STing for its communication.

Now to this end I haven't done much but have noticed that a header file (ping.h) is missing from the example source code for the ping utility. Anyone know where I can get this missing file? Also are there any other examples of using STing (especially those written using Lattice C) ?

Thanks.

Spencer

: Also.. just as 320x200 can be made to display 512 colours in a limited
: fashion, or even 4096 on a STANDARD ST (or 19200+ on STe), any way of
: increasing colours in medium res

That _should_ be possible using the same method as 512 colour display
(ie. palette switching in scanlines). You'd probably get less than
512 colours though, but I guess that something like 8 or 16 colours per
scanline should at least be possible?

: -- or even introducing some greyscale
: to high res mode?

That has been done, usually with a hell of a lot of flickering though...

: Even just four greys. 16 colours in medium res +
: 240-line overscan + your interlace program + a flicker-reducing filter =
: a passable VGA resolution display..!

And no CPU time left. :-) (presuming you'd have enough CPU time to
achieve the above)

By the way, does anyone have some commented Spectrum 512 (and/or 4096)
display code or know where I can find some?

You don't have to know the structure of a resource file, and not much
needs to be known about the structure of object trees either. It is
enough to just make it look right and give names to those objects you
need to access via code.

Menus and dialogs are both 'trees' the only difference being a menu
has a more rigid format. The editor deals with that anyway. You need
to find the option to create a "new tree".

By far the best way to figure out what is going on is to load the
resource files from other applications. Use a copy though because some
editors autosave.

Once you've created a new tree you'll typically have a G_BOX and this
is the root object. Give it a name. You may drop other objects onto it
and name the ones you need to manipulate.

Say you started with a new resource ...

Create a new tree. Name it F0.
Drop an editable object onto F0. Name this F0E0.
Drop a button onto F0. Name this F0B0.

Assuming C ...
Save the resource as C.RSC ensuring the option in the editor (if
applicable) is set so that it writes a C header file. This will be
called C.H

```
#include <yer_gem_lib>
#include "c.rsc"

int
main()
{OBJECT *ob;

appl_init();
rsrc_load("C.RSC");
```

```
rsrc_gaddr(R_TREE,F0,&ob);
ob[0].ob_x = 20;
ob[0].ob_y = 40;
objc_draw(ob,ROOT,MAX_DEPTH,0,0,1000,1000);
evnt_timer(5000,0);
ob[F0B0].ob_state |= SELECTED;
objc_draw(ob,F0B0,MAX_DEPTH,0,0,1000,1000);
evnt_timer(5000,0);

rsrc_free();
appl_exit();
return 0;
}
```

Now go back to the editor and ensure button F0B0 has its EXIT flag set. Save C.RSC and try this more useful example ...

```
main()
{OBJECT *ob;
int x,y,w,h;

appl_init();
rsrc_load("C.RSC");
rsrc_gaddr(R_TREE,F0,&ob);

form_center(ob,&x,&y,&w,&h);
form_dial(FMD_START,1,1,1,1,x,y,w,h);
objc_draw(ob,ROOT,MAX_DEPTH,x,y,w,h);
r = form_do(ob,F0E0);
ob[r].ob_state &= ~SELECTED;
form_dial(FMD_FINISH,1,1,1,1,x,y,w,h);

rsrc_free();
appl_exit();
return 0;
}
```

Thanks. I had a quick look at whilst at work but will download later.

BTW your homepage URL didn't appear to be 100% correct. I tried the
URL listed above which gave me a non-existant error so went directly
to the vcf-com directory which then allowed me to select your page.

Hi!

Jo Even Skarstein <joska@nuts.edu> wrote:
> I'm interested!

OK, you'll find it at the bottom. My improvements were:

- Now allows quoted characters in ranges (e.g. [\[\]] to match either
bracket)
- No longer reads past the end of malformed patterns

Of course, I can't guarantee I haven't introduced new problems, so
beware ;)

Also note that this is not a POSIX-wildcard matching routine, as POSIX
also wants character classes (e.g. [:upper:]). For such a beast, consult
the source of bash (the UNIX shell).

Ciao

Thomas

I've made the change to the code, and I'll certainly keep these details in
mind when this situation arises again.

Had a quick scan through of the docs, couldn't find anything - but I
go blind sometimes, so who knows ;-)
I do try to use ANSI functions only (where possible), I'll make an
exception with strdup() - 'cause it's handy! It'll just make things
easier if/when I use a different complier (hmmm.. well that's the
theory)

I've been browsing through this C book by David Spuler - titled,
Comprehensive C. It's well written, and covers topics in great detail.
One of the later chapters covers debugging techniques, and includes
source code for encapsulating dynamic memory allocation.
It looks very good, and once I've typed it all (ugh!) I'll send you a
copy if you like, unless of course you want to hunt the book down your
self at the library...

Another thing, It was pointed out to me in a recent e-mail (hi Ralf!)
that in the first section of code, I should be making a copy of the
pointer that getenv() returns, so that strtok() doesn't mess with the

environment variable directly. Using strdup() solved the problem.

Thanks again,
Karl.

2684. screenshots from games ?!!

hi (happy new one 1st :)

i was asked to do some game screenshots e.g Zak McKracken and was
wondering
if there's a save way of doing this as .ACCs usually wont be able to
snap any
screens in games ...
would an ALT-HELP routine do ?
or will the most games disable resistant interrupt routines ?!

thx in adv and regards

I don't think so.

> or will the most games disable resistant interrupt routines ?!

I think so.

There used to be some ripper cartridges that did that, and allowed you
to hack the game, set extra lives, rip the music, stuff like that.

The other solution is through emulation. Run the emulator under W95 and
use the Print Screen key to make a screenshot, then paste it into your
favorite graphics program.

Many might say this is "going over the top" and in ordinary
circumstances I tend to agree. Imo the same can't be said when the
application is going to be released because the above allows for easy
logging of data conditions to a file, and those statements can be left
in a release, conditional on some command line switch which the end
user can be told to enable if a bug crops up.

>> That way it doesn't matter if strdup() fails. It comes in most handy

>Hey, not bad stuff here.

I'm pleased you think so. I use pointers and dynamic memory allocation heavily so I like my code to crash as soon as possible. ;-))

>> Incidentally, notmem() is specific to my (MWC) compiler. See if
>> Lattice has an equivilent. It interrogates the "arena" (ie list of
>> allocated memory held by the C memory manager) and tells if the
>> pointer came from there or not.
>
>Had a quick scan through of the docs, couldn't find anything - but I
>go blind sometimes, so who knows ;-)

You could always write your own to replace the Lattice one. They are not as involved as you might think, plus you can add extra features to detect leaks etc.

>I do try to use ANSI functions only (where possible), I'll make an
>exception with strdup() - 'cause it's handy! It'll just make things
>easier if/when I use a different complier (hmmm.. well that's the
>theory)

Many C functions are amazingly simple. strdup is one of them ...

```
char*
strdup(const char *s)
{char *p =malloc(strlen(s) + 1);

if (p) strcpy(p,s);
return p;
}
```

Now it doesn't matter if it's part of Ansi or not (I dont know but I think it is) because you can write it yourself!

Offhand, I can't remember what strdup() is supposed to do if 's' is NULL. The behaviour may or may not be defined. I can't recall which choice I went for in mine. 'Fraid you'll have to look that bit up.

>I've been browsing through this C book by David Spuler - titled,
>Comprehensive C. It's well written, and covers topics in great detail.
>One of the later chapters covers debugging techniques, and includes

Definately a good habit to get into, especially with structures which themselves are a good thing.

>It looks very good, and once I've typed it all (ugh!) I'll send you a
>copy if you like, unless of course you want to hunt the book down your
>self at the library...

Thanks. I'll have a look. Never too old to learn something new! :-)

>Another thing, It was pointed out to me in a recent e-mail (hi Ralf!)
>that in the first section of code, I should be making a copy of the

>pointer that getenv() returns, so that strtok() doesn't mess with the
>environment variable directly. Using strdup() solved the problem.

eek! I missed that one.

It's a really good example of a subtle bug though. Code which uses
getenv() tends to do it only once so if the bug didn't appear
immediately it could go unnoticed for years *and* it could affect
other programs.

Might work with Zak. Worth a try.

>or will the most games disable resistant interrupt routines ?!

Most do. I suspect you might be lucky here - iirc the game (and others
like Maniac Mansion) uses LineA for its sprite movement is basically a
game interpreter. There's no real need for intensive graphics so I
reckon (was it LucasArts?) went for portability in the engine.

In any case, the game is hd installable so there's every chance it'll
run with Pacifist. Failing that you might get lucky and locate a
utility that understands the .LFL files and can pull the images out.

Incidentally, if you do choose the Pacifist option and it works please
let me know. I may be a Civilization addict but for sheer enjoyment
Zak was my all time favourite - I wouldn't mind seeing it in action
again!

2688. Small STinG network

Newsgroup: comp.sys.atari.programmer
Date: 1999-01-08 00:00:00 UTC
From: Torbj|rn Gild} <d98gilda@dtek.chalmers.se>
Message-ID: <Pine.SOL.3.96.990108183514.23393A-100000@kleise.dtek.chalmers.se>
Source record: 3305

Hi!

I have just recently got myself another falcon, so now I have two. I thought it would be nice to connect them into some sort of network, so I tried using STinG for that. It`s just that I`m not exactly a pro when it comes to networks, and as yet I haven`t succeeded. I use a null modem cable connected to Modem 2. The cable works perfectly in Connect 2.46, but when trying it with STinG nothing happens when I try to ping the other computer. The ROUTE.TAB file, on both computers, looks like this:

1.1.2.0 255.255.255.0 Modem 2 0.0.0.0
0.0.0.0 0.0.0.0 Modem 2 0.0.0.0

One of the computers has its IP on Modem 2 set to 1.1.2.0, and the other has 1.1.2.1

At first I tried using a Centronics cable, that I built according to the instructions that come with ParallelCopy 3.01. The cable works perfectly together with ParallellCopy, so I had hoped that it would work with STinG too. Since I don`t know what the proper network settings should be like, I couldn`t determine wether the problem came from the cable or my settings. I therefore built a null modem cable also, but it still doesn`t work.

There is one difference when using the Centronics port instead of Modem 2: When viewing the Statistics using the Dialer and when using Modem 2, I noticed that packets are constantly being sent between the two computers. But one of the computers keeps dropping the packets, and the other computer doesn`t get back any packets. When using the Centronics port instead, no packets are sent by any of the computers.

Of course I change `Modem 2` to `Centronics` on the first line in the ROUTE.TAB file, when I use the parallel port.

spencer@SPAMTHISmaelstrom.freeserve.co.uk (Spencer Davies) writes:

> Now to this end I haven't done much but have noticed that a header
> file (ping.h) is missing from the example source code for the ping
> utility. Anyone know where I can get this missing file?

That file only contains three #defines that define names for three RSC file object tree entry numbers. It's not necessary for understanding how the ping works. The compiled version is in the archive as PING.PRG.

> Also are there
> any other examples of using STing (especially those written using
> Lattice C) ?

The Ping code is not a very good example for starting programming. It demonstrates the ICMP interface which is based on callbacks.

Better read the programming section in STING.HYP to learn about the available API calls. Programming networking that way is a lot like file access.

Cheers Peter

Using any viable language to code the minimal pdaimind:

```
/^^^^^^^^^^\ Mind-grid Arrays{ } in Robot PDAI /^^^^^^^^^^\
/visual memory\ _________ / auditory \
| /--------|---------\ / LANG-UK \ | memory |
| | recog-|nition | \_________/---|-------------\ |
| ___|___ | | flush-vector| | ________ | |
| /image \ | ____V_ ____V__ | / \ | |
| / percept \ | /psi{ }\------/ uk{ } \----|-/ ear{ } \| |
| \ engrams /---|---/concepts\----/ lexicon \---|-\ phonemes / |
| \_______/ | \________/ \_________/ | \________/ |
```

Checklist of steps in coding or porting the PDAIMIND

___ Step 001: In your intended programming language, first make sure that the language will permit you to write a never-ending program that endlessly performs its own computations while only occasionally or periodically checking for input from a human user or from another AI.

___ Step 002: Familiarize yourself with the information flow in the mind-diagram above.

___ Step 003: Create a Web page where you will release each new level of PDAI functionality for the benefit of history and of other individuals working in your target programming language.

___ Step 004: Write some code for getting the input of ASCII characters from the keyboard. Although AI programs which go beyond the basic, minimal pdaimind will need to use speech recognition for the input of actual phonemes of continuous human speech, the pdaimind as an example for other AI programs will make do with simple keyboard text-entry. The http://www.geocities.com/Athens/Agora/7256/m-forth.html Mind.forth AUDITION Screen #9 shows an implementation in Forth with Comments on AUDITION Scr #9 available to show how audition is handled.

___ Step 005: Directly from the World Wide Web, print out your current Internet Web Release as a working document. Freely mark up the hardcopy with corrections, algorithm ideas, URL's, etc., until you have coded enough new functionality to warrant a new, up-to-date Web release.

___ Step 006: Create an array such as ear{ } to store the keyboard text entry.

___ Step 007: Write code for a Comparator which will recognize words already stored in the PDaiMind.

___ Step 008:

___ Step 009:

___ Step 010:

2698. Atari030 DSP programming

Message-ID: <916000150-518802AEicMi@xs4all.nl>
Source record: 3315

Hi,

I bought my CLab-030 machine for HD recording, but I had also some DSP
software writing in mind.
I know of some devoloping software from Atari (RIP) and a DSP-assembler
from a company called HiSoft (RIP as well?).
I have a program called DSP-edit but although I can program in 6800/0
assembly language I can't get grip on this (I think limited softw.?)
Seems that I can no longer buy the stuff I need.
So sad! :((

Guido..

Never heard of that program.

>Seems that I can no longer buy the stuff I need.

Why should you need to buy anything?
For most things you can find very good stuff on the net, for free!

I've always used Motorola's DSP assembler and a couple of other free
programs for my DSP programming, and they all work perfectly well.
Somewhat slow perhaps, but then you're not likely to write anything
very large for the DSP, anyway. ;-)

I don't remember where I found the programs I'm using, but take a look
around the various ftp sites.
If you need some small code samples to get started, I have some Falcon
specific ones here and Motorola has (at least they used to) a relatively
large 56k source library somewhere.

Will do. Time to start downloading some RFC's and having a play.

To which end, what is a good development environment Atari - PC
running Linux or Atari - Atari both running STing? I have spare room
on the PC (and a Redhat 5.1 CD set) as well as the Falcon (without
STing or Mint though). If the Linux route would be better I can go for
that (although more work will need doing in setting it all up) or
stick with the simpler Falcon running STing (though less potential for
testing all areas)?

Thanks.

Spencer

Hi Johan,

Following your advice I've downloaded Motorola's assembler and noticed
that it is a .TTP. (brrrr...:-)
I suppose you use somekind of shell/editor or what?

>If you need some small code samples to get started, I have some Falcon

One piece of equipment that I think is great is Motorola's DSP56000/DSP56001 User's Manual. It's written in a really good way, and without it I wouldn't have learnt the DSP at all. At least it would have taken much, much longer. I think you can order it free of charge from Motorola, via their homepage. At least I have heard from several people that they have ordered User's Manuals for free, and sometimes Motorola even sent more than one copy... :-)

In the User's Manual there are examples of using the three ports of the DSP, and the examples are explained quite extensively.

I really recommend it!

Regards
Henrik

Does anyone have any hints for someone who wants to learn some DSP
assembler but has no 680x0 assembler experience at all.
Documentation, examples and software recommendations are all welcome.
I have a basic knowledge of BASIC (no pun intended!) and I wish to
write some DSP routines for incorporation into BASIC programs.

Cheers,

Ashley

In the light of the fact that there are other DSP-related postings in
c.s.a.p. I'd just like to say that unlike the other poster, I have no
experience whatsoever with 680x0 assembler - so I would have to learn
DSP assembler from the basics upwards. So any ideas? And, I'm also
open for tips on integrating DSP with (probably HiSoft) BASIC.

At least there is the stuff that atarui releazssed for the Falcon. It
is about DSP-use in falcon plus an DSP assembler compiler from
Motorola.
I have the stuff here around. We put it on a PD disk as far as I
remenmber. And there is a box with flops around bearing 'DSP'.

So give me a ring.

Precisely. If you wanna write some client (server) for some service, chances
are good you can find an already existing server (client) for Linux, against
which you can test your software.

For some standard services, servers do exist for STinG too.

If you want to write some networked game, you will most likely end up designing
your own proprietary protocol for which there is no server or client. In that
case of course two identical machines (Ataris with STinG) are the far better
choice.

Cheers Peter

: DSP assembler from the basics upwards.

That shouldn't be a problem -- back when I was a BASIC-only programmer
I learned M68K asm by flipping through an instruction listing (after having
read some info on registers, addressing modes and stuff...)
Assembly is usually pretty easy to learn as it's very locical. The only
really hard part is debugging...
A good place to start would be the DSP and DSP-interface descriptions and
the instruction lists on the sites below.

My page, development doc section: http://atari.scum.org/
The Dead Hackers Society, file section: http://wombat.ludvika.se/dhs/
(haven't had time to add this link to my own page yet...)

You will find some software here as well...

: And, I'm also
: open for tips on integrating DSP with (probably HiSoft) BASIC.

Most of the DSP interfacing is done with XBIOS functions, so that shouldn't
be too much of a problem...
Good Luck,

To anyone who has dropped me a line about Falcon DSP programming:
Thank you very much.
Yet, I have another question: When I try to assemble an .asm file I get
an .cld output file (using Motorola's 56K DSP assembler).
Is this right?
The manual says it should be a .LOD or .LNK file.
I don't think I use the right CL, as I'm not very familair with TTP's.
What would be the right CL asuming all the files are in the same
directory, including the assembler?
This is perhaps a very stupid question, but besides the -A,-B options,
all works fine. (but indeed a bit slow.)
Motorola is kind of hazy about this.
And, additional, would a Shell like Chatwin do any good in my case?

Regards, Guido/THD Studio

Why is it the DSP you want to program in assembler ? A DSP is a rather
specialised device that is not to well suited for everyday tasks. I'd
guess with learning about 680x0 assembler you're better off. If it's
speed you're after, you might well find the CPU (680x0) is fast enough
for what you intent to do, and it's a lot easier.

Cheers Peter

The manual for Interface 2 does deal with constructing RSC files from
scratch, though it's a bit short on how you tie this in with the actual
program file. The English version of program and manual is/was available from
Floppyshop for 25 UKP, though they are closing down end of the month and I
don't know if they have any copies left. If not, contact Tom Thomason,
Vï¿½derlekstorget 12, S-418 32 Gothenburg, Sweden.
He also has an email address but I can't remember it, sorry!

That depends on what one wants to do, doesn't it?
For instance, the DSP is _a lot_ faster on things like fixed-point
calculations and goniometric transformations (it's faster than the CPU
anyway...) plusone could make it work in parallel with the CPU.

j> all seem to assume you already know how to use a previous
j> one or you know the structure of .rsc files.

The manual for Interface 2 does deal with constructing RSC files from
scratch, though it's a bit short on how you tie this in with the actual
program file. The English version of program and manual is/was available from
Floppyshop for 25 UKP, though they are closing down end of the month and I
don't know if they have any copies left. If not, contact Tom Thomason,
Vï¿½derlekstorget 12, S-418 32 Gothenburg, Sweden.
He also has an email address but I can't remember it, sorry!

Regards
/Peter/

2723. GFA/STOS/Spectrum Basic Question

Newsgroup: comp.sys.atari.programmer
Date: 1999-01-15 00:00:00 UTC
From: "Clair D. Shaw" <Clair@shaw1.freeserve.co.uk>
Message-ID: <Trj+$KAoY3n2QwB+@shaw1.freeserve.co.uk>
Source record: 3340

In Spectrum basic you could make a scrolling effect by..

```
10 a$="Scrolling text.............. scrolling text............."
20 print a$(TO 10)
30 a$=a$+1
40 goto 20
```

where 20 would print the string a$ up to 10 characters
30 would make the string "scroll" (e.g. "Hello" would be "elloH")
40 would, of course, loop.

Is there any way this could be done in GFA or STOS Basic?

Hmmm, don't worry, so did I ;-)

Yeah, I'm trying not to think about all the headaches it might have caused :-/
Just glad it was found. Phew :-)

I'll be uploading the source to fopen_env() plus supporting functions (and other
useful procedures I've since created), to my web page soonish. So if anyone
else is interested, you can take a peek sometime next week!

Thanks, I have now loaded up Linux and just have the after
configuration to complete now (like PPP) before I can start messing
about on the TT.

>For some standard services, servers do exist for STinG too.
I've noticed ;-)

>If you want to write some networked game, you will most likely end up designing
>your own proprietary protocol for which there is no server or client. In that
Games aren't really my forte so I am planning on writing some simple
applications. My main worry is that I have never done any GUI
programming so initial efforts are likely to be TOS based only. But
when I am going to attempt a GUI then I shall come back and ask some
more questions. ;-)

Floating point is always a problem: some heave hardware some have
not. And when the have not then there is no emulation for it in TOS.

This grave error can be remedied.

Look at our updated homepage in section download:

http://www.xs4all.nl/~atarist

where there is a floating point emulator.

I experiment a bit with networking and network-programming for both STiNG and MiNTnet, and I always use GlueSTiK and servers running under MiNTnet on the same machine for testing. This works perfectly, and since the Falcon is the only *quiet* machine I have it's also a lot more comfortable than having the TT or PC shifting tons of air around my room.

Btw. Peter, it would have been cool if it was possible to establish a route between STiNG and MiNTnet on the same machine. Then STiNG could act as a IP-masq server (is this possible?), dial-up stack and stack for STiK/STiNG-clients, while MiNTnet could run all it's usual servers and clients. I guess this should be possible by writing suitable packet-drivers (e.g. using pipes or shared memory) for both STiNG and MiNTnet?

Try this:

a$="Scrolling text.............. scrolling text............."
DO
PRINT MID$(a$,1,10)
a$=MID$(a$,2)+LEFT$(a$,1)
LOOP

it should work the same as the Spectrum basic version.

2739. TCP/IP connections

Newsgroup: comp.sys.atari.programmer
Date: 1999-01-20 00:00:00 UTC
From: morloc <morloc@acd.net>
Message-ID: <9Sup2.261$Ot4.2091@newsfeed.slurp.net>
Source record: 3256

Does anyone using an Atari ST know of a program source code that is available that would aid in developing a routine/handler on the Atari 6502 for TCP/IP connection to an ISP? I am currently trying to learn all that I can about TCP/IP, but at this rate it'll take months to understand it, and then additional time to write the routines. Is there a simpler way? Does anyone know for a certainty if the 6502 processor can handle all that a TCP/IP connection and PPP require? I'm asking this from the perspective of can it be done, not "should it be done," or whether it is a waste of time or not to write such a program. I'm trying to write a web browser (text-only) for the Atari XL/XE series computers and to find out an answer to these questions would save me MONTHS of trial and error!

Can anyone help?

Maybe you should look at the KA9Q/NOS source code. You can find it on
the umich atari archive. It gives you a text mode PPP connection for
email and news, it could probably be interfaced with some sort of
lynx-like client. Look at the lynx source for a text based web browser.

I'm not sure if it can be done though. I've never heard of any 8-bit
machine being directly connected to the net. Will it even handle a 14.4K
modem ? I'm not sure if any providers still handle that speed.

You can still always use terminal emulation and a shell account, that
does work.

The Atari 8bit can handle 14.4 and higher, with the aid of an 850 interface
or ICD MIO or the Black Box hardware, which is one of many reasons why I
think this is entirely feasible as a project. I shall certainly look into
the KA9Q you recommended and see what I can come up with, too. I thank you
for your suggestion!!

As a guy in his field (AI), you can take it from me. The man is a grade-A
certified wacko. He's been posting this random gibberish forever in
response to nearly every posting on comp.ai, never once explaining it.
Sure, sometimes genius is cloaked in indecipherability. But usually
indecipherability, especially in a field like AI (believe me), just means
insanity.

I suggest looking at MiNTnet sources or Linux sources.

Although the Atari 6502 architecture is different from the 68k,
you should still be able to extract a lot of source code.

Using those BSD-compatible sockets will also ensure that several
text-based utilities from the Unix universe could be easily ported
to your TCP/IP stack.

There were some attempts at this by some Polish Atari users. Check
out http://yescrew.atari.org/ and contact Draco; he might be able/
willing to help.

> >Maybe you should look at the KA9Q/NOS source code.

I strongly recommend _against_ using KA9Q sources.

If you intend upon persuing the TCP/IP route, then you really ought
to use Linux sources, otherwise, it will be needlessly difficult to
benefit from the Linux efforts when trying to port their stuff.

However, the thiner BSD socket implementation found in MiNTnet might
be easier to adapt than the humongous hierarchy found in fully POSIX
Unices, so it might be a better choice.

The best place to find current MiNTnet sources (and MiNT) is at:
ftp://ftp.funet.fi/pub/atari/mint/

> The Atari 8bit can handle 14.4 and higher, with the aid of an 850
> interface or ICD MIO or the Black Box hardware, which is one of many

Indeed, the hardware is capable. ;-)

> >You can still always use terminal emulation and a shell account,
> >that does work.
>
> Nah! Why settle for less than the best? ;->

Actually, TCP/IP is not necessarily the best approach.

For instance, I needed a permanent textmode screen to monitor my
FTP/HTTP server's activities (who logs in when, etc.) and using
TCP/IP would have made this needlessly slow and tedious to config
and maintain.

Instead, I run CoNnect (currently the _best_ VT52/100/102/220 term
available on TOS) on a spare ST. Then, a nullmodem cable towards
the fileserver, plus an instruction on my fileserver's boot script
to automatically login whatever is on that port as Root user.

Simple quick, efficient.

That ST doesn't even need a hard-disk, since CoNnect and NVDI (the
screendrawing routines accelerator) fit on a single floppy disk,
which can be configured to auto-start upon powering up the ST.

Anyways, just a thought. ;-)

The sources for MiNTnet is freely available, I guess you can pick up a thing
or two there. But in general these sources are not applicable on 8-bit
systems.

I'm sure you can find lots of help and inspiration in the LUnix-project.
LUnix is a basic and *extremely* compact unix-clone for the C=64, perhaps you
can port it to the Atari?

Get a life, Arthur.

> http://www.auburn.edu/~vestmon/robotics.html Three Laws of Robotics.

This has absolutely nothing to do with your nutcase stuff.

> http://www.geocities.com/Athens/Agora/7256/acm.html the Singularity of

This merely says the exact same thing you had posted.

> http://www.ugcs.caltech.edu/~phoenix/vinge/vinge-sing.html Vernor Vinge.

This also has nothing to do with it (other than your "borrowing" of
certain obscure semantic references).

As nearly everyone in comp.ai (one of the very few groups that would even
be remotely receptive to your inanit), has added you to their killfiles,
you should realize that spamming unrelated programmer groups isn't going
to help your case much.

I accept that his ideas do not fit in with the current mainstream AI thinking, but that does not automaticaly, in and of itself, mean that he is wrong and you are right, even if he does happen to be wrong, and you to be right.

Have you given him a fair hearing?

SL> He's been posting this random gibberish forever in response to nearly
SL> every posting on comp.ai, never once explaining it.

Have you followed up on his URLs? There appears to be a modicum of explanation there. Perhaps he thought that refering people to an explanation elsewhere was sufficient. Perhaps he thought that he WAS explaining. I don't know, as I wasn't there.

SL> Sure, sometimes genius is cloaked in indecipherability.

and great genius nearly always so.

SL> But usually indecipherability, especially in a field like AI (believe
SL> me), just means insanity.

Then too, many of the great geniuses were also insane.

As for this Mentifex character, I think that what he has to say is at least *interesting*, even if it should turn out that he's barking up the wrong tree.

All I know for certain is that the introduction to the intended purpose of his Public Domain Artificial Inteligence Mind project is dead-on truth on more than one account:

==8<--
23dec1998: The pdaimind -- implemented here as Mind.forth -- is the simplest possible foundation of artificial intelligence (AI). The pdaimind is a bare-bones, minimum AI for two main reasons.

Firstly, the machine intelligence to which we aspire unavoidably requires a Chardinesque compexity which Nature labored for eons to achieve. Our top-down, Chomskyan approach must match the key features of evolutionary intelligence or we will fail to demonstrate a thinking, conscious mind.

Secondly, if we demonstrate a bare-bones, minimal AI, then the pdaimind becomes a repeatable experiment, a reproducible test of AI functionality for a broad range of programming languages.

If you see a better way, please, step forward and be recognized.
-->8==

First, is there any OTHER way to demonstrate a thinking, concious mind, than by comparison with another thinking, concious mind? To date, the only thinking, concious minds we have for comparison are complex natural minds.

Second, a repeatable experiment, a reproducable test, is essential to prove that a single success is not a fluke, but the real thing.

What Mr. MindMaker is attempting may well prove to be impossible, but we'll never know if no-one tries, and he is definitely making a serious attempt to find out if it IS possible.

In my humble opinion, we should support such serious attempts at the presumed-impossible, for we may well find out that some things are not so impossible after all, and will surely learn from the failures as well, if we're paying attention.

Thus, I find what he has to say to be interesting, no matter how contrary it may be to current mainstream AI thinking.

That last line in my clip of his text is telling:

How does he react to people who claim to have a better way?

SL> Sean

See ya on the Bit Stream! The Hungry Hacker.

* Artificial Intelligence: The other guy's opinion.

> clients. I guess this should be possible by writing suitable packet-drivers
> (e.g. using pipes or shared memory) for both STiNG and MiNTnet?

I'd guess so. However I have no idea how to write a device driver for MiNTnet.
If you wanna do it, you can have the Ethernet driver source code for the STinG
counterpart, it should be easy to strip the Ethernet stuff and leave in place
all you need for the pipe driver or whatever you wanna call it.

Note you may run into trouble due to lacking reentrancy in MiNT (dunno how much
is there) : the driver code (along with the Fread and Fwrite to the pipe) will
be called from interrupt. So maybe a shared memory approach is the better solu-
tion.

Actually, if you make the MiNTnet driver behave like a LANCE (it's got a rather
nice memory interface - DMA), the STinG driver mods are a matter of half an hour.
I'd do that if you like.

Cheers Peter

Sure. However someone who doesn't know the main programming language of his
machine is unlikely to be able to judge if some task he wants performed
can be easily done in that language too. That's why I mentioned he should
investigate this first, as programming his 68030 is a lot more convenient,
if not easier. Also, non-Falcon users can benefit from his code too.

Dear Madam, Dear sir,

We are proud to announce you the CENTurbo II B will
be ready to be sold the sixth week (February, 8-12).

All the informations are NOW AVAILABLE on our
WEB site: www.centek.fr.

Have a look on our compatibility (not limited) list
and our incredible performances tests with:

PAPYRUS 7
PHOTOLINE 2.24
POV 3 (vase script)
SANDRINE 4.0

GCC 2.7.2
PURE C
DEVPAC 3.10

CUBASE 2.06
V-TRAX 1.0
FIVE TO FIVE 2.13

CAB 2.7
ST ZIP 2.6

PRICES:
- Final customers: 289 euros (Inc. French VAT at 20.6 %)
- Distributors (no taxes):
x 1 180 euros/unit
x 5 175 euros/unit
x10 170 euros/unit
- Transport: contact us by e-mail or fax.

NEXT EMAIL: End of this month for the PHENIX Rev 1 !!

Yours Sincerely.

2759. CENTurbo II correction

Newsgroup: comp.sys.atari.programmer
Date: 1999-01-24 00:00:00 UTC
From: centek <vxp@imaginet.fr>
Message-ID: <78fb9s$dp0$1@news.imaginet.fr>
Source record: 3276

The english text follows this one.

Notre dernier message concernant la CT2B contient une information
incomplete:
Il n'y a pas de soudures entre la CT2B et le cable nappe et non
pas entre la CT2B et la carte mere.
Une nappe de 16 fils est fournie.
Un cote doit etre soude sur la carte mere et l'autre cote est un
connecteur
a plugger sur le bord droit de la CT2B. Ainsi on peut retirer et changer
la
CT2B sans aucune soudure.

Sincerement

ENGLISH

Our last message about the CT2B contains an incomplete
information:
There are no solders between the CT2B and the ribbon cable, not
between the CT2B and the motherboard.
A 16 wires ribbon cable is furnished.
One side has to be soldered on the motherboard and the other
side is a connector to be plugge'd on the right side of the
CT2 B.
So, you can remove and change the CT2B without any solders.

Regards

I accept that his ideas do not fit in with the current mainstream
AI thinking, but that does not automaticaly, in and of itself, mean
that he is wrong and you are right, even if he does happen to be
wrong, and you to be right.

Have you given him a fair hearing?
<...>
In my humble opinion, we should support such serious attempts at
the presumed-impossible, for we may well find out that some things
are not so impossible after all, and will surely learn from the
failures as well, if we're paying attention.

Thus, I find what he has to say to be interesting, no matter how
contrary it may be to current mainstream AI thinking.

You're on a long and slippery slope. Everyone seems to follow along
nodding with the first mentifex posting that they see. It seems
interesting, different - hey, maybe it's weird enough to succeed!

Things look a bit different after the 150th or so posting that you
see. He posts regularily to comp.arch, for instance. His postings
never really seem to _say_ much. The best I can say is that he
appears to be stuck in the "posing college-age cafe dude" stage of
development, without the ability to break through to the next level
(going from talking about how things are going to come together to
bringing them together).

[Hey, I feel for mentifex, I get stuck in a similar stage every couple
months. But I try to keep my Usenet postings more varied and
interesting. :-),]

Given the intentions of the original poster, this is a rather silly idea.
For a 6502 implementation, one needs every bit of efficiency one can think
of. The ka9q implementation is not bad in this respect, while bloated (in
terms of memory requirements) implementations like Linux or BSD are useless
in the situation where the total available address space is *less* than a
maximum size IP packet !

Nice of you to say so ;-)

>investigate this first, as programming his 68030 is a lot more convenient,
>if not easier. Also, non-Falcon users can benefit from his code too.

As I mentioned in my unanswered private email to you, I want to learn
DSP assembler in order to use the Falcon's DSP in audio applications I
intend to write. This is obviously a Falcon-specific task.

If 68k is no easier to learn than 56k as you state - and I have the
greatest respect for your programming knowledge, freely admitting that
my own knowledge is lacking - and I only want to use assembler to
utilise the Falcon's DSP chip for audio routines, then why learn 68k
first?

Who knows, perhaps after learning a bit of 56k I'll move on to 68k and
recode some of the BASIC code in my software into 68k assembler ;-)

Cheers,

Ashley

Hi,

> Does anyone know for a certainty if the 6502 processor can handle all
> that a TCP/IP connection and PPP require?

The processor itself should be capable of running a TCP/IP node. But you should consider other system requirements. Memory, serial port and disk space for example.

The hard part will be writing the actual TCP/IP stack, the user protocols such as SMTP, POP3 and NNTP are relatively easy to do.

> I'm trying to write a web browser (text-only) for the Atari XL/XE series
> computers and to find out an answer to these questions would save me
> MONTHS of trial and error!

Even simple text based browsers are very processor intensive. Good luck. :)

I have an excellent book - TCP/IP Blueprints by SAMS Publishing. The ISBN is 0-672-31055-4, get it from your library or buy it for around ukp35. It explains everything about TCP/IP in a straightforward and understandable way. It was published in 1997 so it is pretty upto date and includes IPv6.

John.

SH> You're on a long and slippery slope. Everyone seems to follow along
SH> nodding with the first mentifex posting that they see. It seems
SH> interesting, different - hey, maybe it's weird enough to succeed!

Even if it doesn't, we still should be able to learn from it.

SH> Things look a bit different after the 150th or so posting that you
SH> see. He posts regularily to comp.arch, for instance. His postings
SH> never really seem to _say_ much. The best I can say is that he appears
SH> to be stuck in the "posing college-age cafe dude" stage of
SH> development, without the ability to break through to the next level
SH> (going from talking about how things are going to come together to
SH> _bringing_ them together).

Re the 150th posting:

Perhaps so, but I intend to delve much deeper than merely reading his public postings in the newsgroups. He has published SOURCE, and I intend to port the project to another language, partly as a learning exercise for the new language, and partly because this particular project looks interesting.

Re the stage of development of his PDAI Mind project, and _bringing_ things together:

I don't know how far along development currently is, as I haven't begun the port yet [FORTH is too low-level and write-mostly to port easily to other languages, and I don't yet have the ARexx source he's posted to Aminet, because I don't yet know where on Aminet to look for it], but it is clear that he IS engaged in ACTIVE development of PDAI Mind project. Where that development is leading is another question entirely.

SH> [Hey, I feel for mentifex, I get stuck in a similar stage every couple
SH> months.

Don't we all, on occasion?

SH> But I try to keep my Usenet postings more varied and interesting.
SH> :-),]

As do most of us.

Re this and Mr. MindMaker's postings never seeming to _say_ much:

It is possible that Mr. MindMaker, like many of us, has some difficulty communicating his ideas to other folk.

SH> scott hess <scott@doubleu.com> (###) ###-####

Actually, there is a minimal C64 port of Linux out there, so that
would probably be even better than KA9Q since C64 is 6502 based
and has a maximum of 64KB of RAM (AFAIR).

Knowing 68000 coding I had a look at a Falcon and the DSP.
Also same thinking: get the DSP do nice things with sound.
But I found out that what runs on the DSP are standard signal-
processing functions.
Every effect you want is or can be formulated as a mathematical
formula in the end.
There are building blocks of code: Motorola has made a BIG library.
So really the task is: find the function you want in the library, not
trivial as do not know about signal processing.
All you need to know is: how to load functions in the DSP, run them,
send and retrieve data etc.
There are Falcon functions calls for that.
So then the thing to do is: use the programming language you like and
use those system calls.
Nobody stops you from learning DSP assembler, but boy o boy, those
instructions are much more difficult to understand and terrible
difficult to use.
Take the following part of a listing:

```
fmpy.s d9,d7,d1 y:(r1),d7.s
do n0,end_bfy
fmpy d8,d6,d2 fadds d3,d0 x:(r0),d4.s d2.s,y:(r5)+

end so on.....
```

From: cogre@xanth.com
Message-ID: <pOSr2.5390$9P6.14894037@newsgate.direct.ca>
Source record: 3288

Hi there, does anyone know of where I could get my hands on some basic programming manuals for the atari 800??? Or maybe where I could download some reference material that would get me started (again). Its been many years since I have done anything with the Atari systems and I have misplaced my documentation for them. I would like to get my kids started up using something simple so that they can see how basic programming goes before they move onto something more complicated.

Thanks in Advance

Mindrx941126.lha misc/misc 52K 211+Amiga AI public-domain work-in-progress.
MindRexx.lha util/rexx 21K 265+Project Mentifex's AI prototype
Mindrx.lha util/rexx 28K 230+Project Mentifex's Arexx based AI design

http://www.geocities.com/Athens/Agora/7256/m-forth.html Mind.forth
is already superior to the 26nov1994 Mind.rexx referred to above.
Mind.rexx is an example of patching things together with chewing
gum and Band-Aids. REXX (or Amiga ARexx as used in Mind.rexx)
imposes no discipline on the programmer, while Forth demands and
ensures hierarchical structured programming.

You will notice a very peculiar thing about this "pdaimind" code.
Until Mind.forth has "quickened" or attained a minimal functionality,
all the strategic planning in the program will remain opaque and
senseless to you, even if small segments of the code make sense.

As soon as "Snow Crash" gets through "Burn Rate" to "Code Complete",
two distinct phenomena will become operative. People who run the
AI program will see exactly what it is doing -- and whether it even
truly qualifies as AI. More importantly -- especially for such a
fragile, brittle program as an artificial mind -- people with a lot
more smarts than very truly yours Arthur/mentifex will be motivated
to see what Mind.forth does: break concepts down into AI playdough.

2773. Emulators on Falcon and Millian

And you may not find exactly what you want, so some modifications may
be necessary.

>send and retrieve data etc.
>There are Falcon functions calls for that.

If those are fast enough for you. It's not difficult to write your own,
but then of course they won't work with a third party DSP card, if any
of those ever showed up.

>Take the following part of a listing:
>
>fmpy.s d9,d7,d1 y:(r1),d7.s
>do n0,end_bfy
>fmpy d8,d6,d2 fadds d3,d0 x:(r0),d4.s d2.s,y:(r5)+

That's not for the right processor, you know.
I don't really know what it might be, but perhaps a 96001?

Below is a short code snippet for the 56001.
Not really that complicated, but it can of course get worse. The difficult
part, IMHO, of writing 56k code is to really get the most out of it.

Back when I wrote the DSP convolution routines for MGIF, I took a look at
the .LOD files from a demo of one of the commercial image processing
programs and it was a complete mess! My C code on the CPU was almost as
fast as their 'DSP optimized' version (when including the CPU->DSP->CPU
communication overhead), while my own DSP code improved on the CPU by
about an order of magnitude (also including overhead).

(I hope the commercial program in question (don't know which one it was)
has gotten that horrible code replaced by now.)
If you want to see some really fast DSP filtering code in action, I suggest
you try MGIF out and test the convolution (3x3 and 5x5) or median (3x3)
filters with DSP support turned on (should be on by default, but I think
the CPU<->DSP handshaking defaults to more than is necessary on other than
very fast Falcons (see MGIF.OPT and/or the docs on how to change that)).

```

> Mindrx.lha util/rexx 28K 230+Project Mentifex's Arexx based AI design
>
> http://www.geocities.com/Athens/Agora/7256/m-forth.html Mind.forth
> is already superior to the 26nov1994 Mind.rexx referred to above.
> Mind.rexx is an example of patching things together with chewing
> gum and Band-Aids. REXX (or Amiga ARexx as used in Mind.rexx)
> imposes no discipline on the programmer, while Forth demands and
> ensures hierarchical structured programming.

Whichever way you look at it - Pascal was usually accused of that while it
was in an old Forth manual where I read a sentence like this: "Programming
is not a science but an artform, since every programmer will find a quite
different and quite individual solution to any given problem."

Of course there needs to be discipline in art too... ;)

> You will notice a very peculiar thing about this "pdaimind" code.
> Until Mind.forth has "quickened" or attained a minimal functionality,
> all the strategic planning in the program will remain opaque and
> senseless to you, even if small segments of the code make sense.

IMHO, you've been watching too much tv - that series with the music by Queen
- but you're right. I wasn't impressed, but then I looked at it out of
curiosity only - instead of playing some game. You know: all work and no
play... ;)

> As soon as "Snow Crash" gets through "Burn Rate" to "Code Complete",
> two distinct phenomena will become operative. People who run the
> AI program will see exactly what it is doing -- and whether it even
> truly qualifies as AI. More importantly -- especially for such a

> to see what Mind.forth does: break concepts down into AI playdough.

:) I like your choice of program versions - "Burn Rate" - hmmm. :)

2776. Help coding ethernet driver

Newsgroup: comp.sys.atari.programmer
Date: 1999-01-29 00:00:00 UTC
From: lvzon@bio.vu.nl
Message-ID: <78sa1v$942$1@feresa.bio.vu.nl>
Source record: 3293
Cross-posted to: comp.sys.atari.programmer,comp.sys.atari.st.tech,comp.sys.atari.st

OK, I know that it's nearly a death sin to ask this, and I normally
wouldn't even think about doing so, but... I need someone to help me
to trace down a nasty bug.
Now before people start flaming me, let me explain myself, as this may
be of some interest to others as well...

A few months ago I started looking for a cheap method to connect my
Falcon to an ethernet. After considering various types of adapter I
concluded that the best thing would be for me to buy a little device
based on the RealTek RTL8012 chipset. Now this little fella' is a
parallel port ethernet adapter, a bit like the good old DE-600, only
with much better specs and easier to get. I picked one up second-hand for
less than 30 euro, downloaded the data sheet and PC-Linux driver code,
hooked the thing up to the parallel and EJP ports and started coding...
A Belgian fellow called Karl Samyn, who was so kind to aid me in the process
of choosing the best ethernet solution, attended me to the fact that two
French guys, Eric Gaudet and Rodolphe Pineau, were also working on a driver
for the RTL8012. I contacted them, and they were so kind to send me the
code they had so far. Unfortunaly it was all in assembly, pretty hard to
read and not very suitable for what I had in mind (MiNTNet).
Plus I didn't have a macro assembler and proper debugger to test it,
and I didn't want to wait months for them to finish it, as I'm in a bit
of a hurry to get this thing up and working...

The next three months or so were spent debugging a few kb of my own code.
I am now able to access the control registers and read out the
packet buffer using various transfer modes. Once. After that the
device locks up and I have to reset all power lines, including my Falcon.
And _that's_ the problem: I'm stuck.
I've been stuck before, of course, but this one bug is starting to drive
me insane, up to the point of thinking about giving up.
I've spent the last month going over and over my code, other people's
code and the data sheets, found and fixed loads of bugs,
took lots of breaks to calm down and think and even managed to get some
work done for university, but it _still_ doesn't work! Aaarrrgghh!

The previous two times I got stuck it turned out to be some
really silly bug which I just didn't notice for a week or so,
and I wouldn't be surprised if it were something like that again.
On the other hand, I could well be doing something basically wrong
on the software or hardware (difficult to trace, I only have an ancient
multimeter which is very unreliable) level, as I'm not an expert on these
things.
It would *really* help if someone with a fresh perspective on things

were to take a look at the code (GCC C and assembly) and the hardware
design. Even a hint at what the problem could be would be superb.
I tried contacting the two French dudes, but they haven't replied.
So that's why I'm trying this slightly more radical approach.
If there's anyone who'd like to help out on this, please reply by
email and I will mail you the details (my notes, the code and the
data sheets) or put them up on my website. And remember, it's for
a good cause: a cheap ethernet solution for Falcons (and in the future,
STE and others as well)!

Thanks,

Is this a disc based data file.
I have a sort routine that you can sort disc files, arrays, or whatever
your fancy. It parces the items to be sorted and breaks down to alpha
and numeric. sorts P141 > P15 , which is not like normal string sort.
Its GFA Basic. Let me know if you want and I'll mail you.

<snip>

What a stupid decision, IMO. The biggest thing the Phenix has to worry about is it having no credability due to repeated delays, and the fact that by the time that it is finally released people will have either jumped ship, or bought Milans....

This is almost as bad as Wizztronics...

Source record: 3296

The last news about the PHENIX 040/060

At the end of December, at the very time when the E15 version of the PHENIX motherboard was ready to be produced for the developers, CENTEK decided to bring some important changes about the hardware architecture of
this motherboard.
Here is the list of the major changes introducing the R1 (Rev.1) version of
the PHENIX 040/060:

- The DSP56301 is now connected on the PCI bus.
- A card with 3 other DSP could be plugged into a PCI slot, not into a dedicated slot.
- The ULTRA-SCSI and USB (2 ports) controllers have been replaced. The new
ones are connected on the PCI bus.
- Two IDE (ATA-4) connectors are now officially provided thanks to a new component on the PCI bus. Four peripherals are so possible.
- The MIDI, SERIAL & // ports are suppressed. They are possible with some USB interfaces, opening the way of the future.
- The QUICC chip is suppressed.
- The EDO RAM is replaced by the SDRAM; it is 2 times cheaper and 2 times
faster (with the 060).

Why these modifications ?

The first objective was to reduce the production cost: the suppression of
the QUICC and the transfert of some functionalities on the PCI bus (to reduce the programmable logic cost) follows this objective.
The reduction of the cost continues actually to equilibrate the cost of the
performances increase.

The second objective was to take in count the remarks of some developers (like Soundpool) in the domain of the DSPs. They was wishing to have faster
transferts between the DSPs. With the DSP on the PCI bus, the hardware architecture is optimum.

At CENTEK, we were wishing to reduce as much as possible the necessity of
the CPU use to transfert the DATA. For that reason, the USCSI and USB are

too on the PCI bus.

The performances ?

Imagine the heavy task that reads a movie from a DVD disk.
The hard disd drive (HDD) (Ultra-SCSI or Ultra-IDE) transferts the AUDIO
and VIDEO DATA (MPEG2) to the controler (USCSI or IDE) that transferts
on
the PCI bus with BURST at 132 MBytes/s to one DSP56301 to uncompress
(real
time) the AUDIO and one (or more) other DSP to uncompress the VIDEO.
Each DSP sends the results to the final destinataries:
- the AUDIO to the 20-Bit CODEC (on motherboard) by the DSP-CODEC serial
link.
- the VIDEO to the GRAPHIC card by the PCI bus at 132 MBytes/s (BURST).

Conclusion: no important CPU intervention which continues to run into
the
system SDRAM on the other side of the PCI-040 BUS bridge !
This is the undebatable superiority of the PCI architectured computers,
not
like the simple 'PCI as peripheral' architecture !
Have a look on our functional block diagram.

The final objective was to draw nearer to this total PCI architecture
faster
than it was previously planned to easely introduce the new future
computers
like the PHENIX 2 (code name). The PHENIX is now comparable with the
architecture of the last generation of PC.

The choice of the new PCI components was the principal reason of a new
delay
to terminate the motherboard. We now terminate the PCB routing...

2781. G++ 2.8.1 Virtual Memory problem

Newsgroup: comp.sys.atari.programmer
Date: 1999-02-01 00:00:00 UTC
From: GIO@my-dejanews.com
Message-ID: <794bmjsie1@nnrp1.dejanews.com>
Source record: 3297

I'm trying to build the APFLOAT arbitrary-precision maths package on a (Gemulated) 14meg ST using G++ 2.8.1 running under KGMD, but I'm getting an error message to the effect of "Not enough virtual memory".

As the "ST" is a base ST (ie 68000 based), is there anything I can do to get around this? Is there a setting with the G++ source that I could tweak, or will I have to download the 5.2 beta which can cope with '030s, and use Outside (or similar) to generate some virtual memory?

Any help would be appreciated...

Gio

P.S. Someone asked after the 2.8.1 libs a while back; does anyone know if they have been ported yet, or is the silence since a sign that it hasn't happened?

G++ 2.8.1 is very memory expensive, so you need more, virtual or
physical,
and the more the better.

Seems to be so, nothing heard about.

Ralph

2784. Problem w/ GEM program...

Newsgroup: comp.sys.atari.programmer
Date: 1999-02-03 00:00:00 UTC
From: quantum@voicenet.com
Message-ID: <vAPt2.340$x4.304926@news3.voicenet.com>
Source record: 3151

Greetings,
I'm new to GEM programming and I'm having problems trying to
get a program started. I'm using Hisoft's HISpeed Pascal, mostly
because I can't get G++ working, but that's of course another post. I
can't seem how to put whatever the user types into a TEDINFO block
into a variable. My docs are useless for it, and I've tried
everything. Here's one of the procedures I'm writing that requires
it. Basically, the program is a setup for a login/password program
that will give standard TOS users the ability to configure different
environments much like Window$ does. Anyway, I appreciate and thank
anyone in advance who can help me with this, or at least point me in
the right direction.

Thank you in advance,
George Garner

P.S.> Here's the program block...

```
Procedure do_add_new;
{Handles the input for adding a user.}
var
ch: char;
x, y, w, h, object: integer;
a, address: pointer;
pass: pointer;
password: string;
return: LongInt;
temp: text;
begin
rsrc_gaddr(R_TREE, USER_PASS_DIAL, address);
form_center(address,x,y,w,h);

form_dial(FMD_START, 0,LASTOB,0,0,x,y,w,h);
objc_draw(address,0,20,x,y,0,0);

object:= form_do(address,0);

{****** I just need to know how to retrieve the login name and
password from what the user enters. Again, any ability to point me in
the right direction is greatly appreciated *******}

rsrc_gaddr(R_TEDINFO, LOGIN_INPUT, password);

form_dial(FMD_FINISH, 0,LASTOB,0,0,x,y,w,h);

rsrc_gaddr(R_TREE, MENUBAR, address);
menu_tnormal(address,USER_MENU,1);
```

```
end;
```

I have no experience with Pascal under GEM, but it's possible that
your problem is caused by you using Pascal-type strings and the AES
returns C-strings. Isn't there any examples in the HiSoft-package you
can look at?

Circa 28-Jan-99 22:20:02, the ineffable Arthur T. Murray, aka uj797@victoria.tc.ca, commited the following text to public scrutiny:

ATM> "phineas" <phineas@NOSPAM.demon.co.uk> contributed on 28 Jan 1999:

p>> When out of my head on "comp.sys.amiga.programmer", this remark by
p>> lwickjr@i2k.com still made some sense:

LW>>> I don't know how far along development currently is, as I haven't
LW>>> begun the port yet [FORTH is too low-level and write-mostly to port
LW>>> easily to other languages,

p>> Hmmm, FORTH used to be fun on the Sinclair Spectrum... #:)=

Likewise on the C=64. *8{) I must admit, however, that it isn't easily readable after having not programmed in it in several years.

LW>>> and I don't yet have the ARexx source he's posted to Aminet, because
LW>>> I don't yet know where on Aminet to look for it],

p>> Allow me:

ATM> Mindrx941126.lha misc/misc 52K 211+Amiga AI public-domain work-in-progress.
ATM> MindRexx.lha util/rexx 21K 265+Project Mentifex's AI prototype
ATM> Mindrx.lha util/rexx 28K 230+Project Mentifex's Arexx based AI design

ATM> http://www.geocities.com/Athens/Agora/7256/m-forth.html Mind.forth is
ATM> already superior to the 26nov1994 Mind.rexx referred to above.

I still need a starting point for my port, and since ARexx is closer in style to Python than is Forth, I prefer to start with Mind.Rexx, rather than Mind.Forth.

ATM> Mind.rexx is an example of patching things together with chewing gum
ATM> and Band-Aids. REXX (or Amiga ARexx as used in Mind.rexx) imposes no
ATM> discipline on the programmer, while Forth demands and ensures
ATM> hierarchical structured programming.

Not strictly true: FORTH also gives you all the tools you need to throw the rules of hierarchical structured programming out the window. One can write spaghetti code in ANY programming language.

ATM> You will notice a very peculiar thing about this "pdaimind" code.
ATM> Until Mind.forth has "quickened" or attained a minimal
ATM> functionality, all the strategic planning in the program will remain
ATM> opaque and senseless to you, even if small segments of the code make

ATM> sense.

Be careful, Mr. MindMaker: saying things like that is an open invitation for people to limber up their flamethrowers. Remember that it is _possible_ that the program as a whole may remain sensless, even to a programmer who has studied the source, successfully ported it to another language, and fully understands what everything does.

ATM> As soon as "Snow Crash" gets through "Burn Rate" to "Code Complete",

What do these terms mean?

ATM> two distinct phenomena will become operative. People who run the AI
ATM> program will see exactly what it is doing -- and whether it even
ATM> truly qualifies as AI. More importantly -- especially for such a
ATM> fragile, brittle program as an artificial mind -- people with a lot
ATM> more smarts than very truly yours Arthur/mentifex will be motivated
ATM> to see what Mind.forth does: break concepts down into AI playdough.

Your code already provides plenty of opportunity for people who run the unfinished code to see exactly what it is doing -- and whether it qualifies as AI.

Some people, myself included, are already motivated to see what the PDAI Mind does --and does NOT-- do. I hope that the program gets more --rather than less-- interesting as it nears compleation.

See ya on the Bit Stream! The Hungry Hacker, looking for work. Got any?

* Despite the high cost of living, it remains popular.

2788. What Happened to the STOS Mailing List

Newsgroup: comp.sys.atari.programmer
Date: 1999-02-04 00:00:00 UTC
From: deano@zetnet.co.uk
Message-ID: <36c0f37f.14078868@news.zetnet.co.uk>
Source record: 3155

I sent a message to it but there is no reply..Has it changed it's email?

I posted a message to it about a problem with the STE extension in Stos. When I load Stos from my Hard Drive (tower with CD Rom), It bombs out as soon as it trys to load the STE extension. I know the extension is not corrupt because it loads ok from floppy disk. Anyone know what the problem is? I use Extendos to mount the CD drive and I have partitions C to G.

>This is almost as bad as Wizztronics...

That's wrong. Many people think that the CENTurbo II doesn't exist and
we
do it... For Phenix, it's the same thing: we work very hard and
WE WILL FINSIH the Phenix too.

Pascal does not interface well to anything written in C, which Gem is. It needs some tools to overcome these problems. They probably exist and you'll need to find them.

>I can't seem how to put whatever the user types into a TEDINFO block

> temp: text;
> begin
> rsrc_gaddr(R_TREE, USER_PASS_DIAL, address);
> form_center(address,x,y,w,h);

How is form_center declared? See if 'address' is a 'pointer' or something else like 'object'. The latter would indicate this pascal has the potential to access fields directly, though the former doesn't exclude it.

```
> form_dial(FMD_START, 0,LASTOB,0,0,x,y,w,h);
> objc_draw(address,0,20,x,y,0,0);
>
> object:= form_do(address,0);
>
>{****** I just need to know how to retrieve the login name and
>password from what the user enters. Again, any ability to point me in
>the right direction is greatly appreciated *******}
```

I assume it works up until the next line?

```
> rsrc_gaddr(R_TEDINFO, LOGIN_INPUT, password);
```

There's all manner of things that could be wrong above. We'd need to see the declaration of rsrc_gaddr to even stand a chance of figuring it out.

a)
The Pascal 'string' and the C string are not compatible.

b)
The Gem rsrc_gaddr returns pointers to things - lots of different things depending on the 1st arg.

c)
I'm not convinced Gem rsrc_gaddr works properly for some of its sub-opcodes. Hence I use R_TREE then access directly (could be wrong, might be my compiler or just my memory).

d)
What, if anything, does the Pascal rsrc_gaddr do with the result from the Gem rsrc_gaddr before it comes back here?

```
> form_dial(FMD_FINISH, 0,LASTOB,0,0,x,y,w,h);
>
> rsrc_gaddr(R_TREE, MENUBAR, address);
> menu_tnormal(address,USER_MENU,1);
> end;
```

> recognize my prog as a client?

Yes, of course. How do you think Thing should know about your window,
if not told by your program? (*)

Thus, you have to register via AV_PROTOKOLL, tell the server about new
windows with AV_ACCWINDOPEN, use AV_ACCWINDCLOSE when a window is
closed, and send AV_EXIT on termination.

Ciao

Thomas

P.S.: Followup-To: set

(*) Yes, I know this is also possible using WF_OWNER, but not all AESes
support this mode for wind_get()

What I needed was a very detailed description on how to use AVPROTOCOL, and maybe the doc's in THING are aimed at people who know how the basics work already. Apart from that, I believe there is nothing missing in the THING doc's.

Since I'm a bit new to programming here, things are seldom that obvious to me. :) Therefore I am very greatful for all help and hints given to me in this group..

Hi,

I have bought a Falcon030, and I stopped programming on PC! It really
S@*&#&@!!! So I will go back to
my ATARI and program it again. I am already programming the 8-bit computers
in assembly but I need
some convertors and write them my self on the Falcon030 and I am looking for
a complete PASCAL
compiler, I have used Borland&Turbo-pascal on PC..... Is there a similar
compiler on Falcon030 ?

Gtx,
Rene

2803. avprotocol again...

Newsgroup: comp.sys.atari.programmer
Date: 1999-02-07 00:00:00 UTC
From: gokmase@hem1.passagen.se
Message-ID: <79jqgv$6nr$1@cubacola.tninet.se>
Source record: 3170

Greetings all,

I'm a bit ashamed of this, but I must admit I still haven't managed to get the global window cycling working. I am definetly doing something very wrong here. I guess I'm doing something fundamentally wrong, so I'll write down how I have tried to do this.. ..please don't laugh.. :)

Am I right when I say that this is always true:

word0 = id of reciever
word1 = id of sender

and that othe values depends on message type?

This is how I tried to do things:

On open window
send AV_ACCWINDOPEN to avserver:

word 0 &H4724
word 1 ap_id& (client)
word 3 window handle

On CTRL-W
send AV_SENDKEY to avserver:

word 0 &H4710
word 1 ap_id&
word 3 &H0004
word 4 &H1107

It works fine when sending CTRL-W to avserver, but it seems like THING never understands the AV_ACCWINDOPEN. Perhaps it is also worth mentioning that I use GFA and not C.

Anyway, thanks for any help I get here. Much appreciated!
Once again, sorry for not having the basics cleared out, but I'm here to learn.. ;)

Regards,

Joakim

Joakim Hï¿½gberg <gokmase@hem1.passagen.se> wrote:
> Am I right when I say that this is always true:

> word0 = id of reciever
> word1 = id of sender

No, the first word is the message, the receiver is given in the call to
appl_write(), but looking at your examples below, it seems you've just
got it wrong in your question, not the code ;)

> On open window
> send AV_ACCWINDOPEN to avserver:

> word 0 &H4724
> word 1 ap_id& (client)
> word 3 window handle

This looks OK, but don't forget to zero all other fields, especially
word 2.

> On CTRL-W
> send AV_SENDKEY to avserver:

> word 0 &H4710
> word 1 ap_id&
> word 3 &H0004
> word 4 &H1107

word 4 should be &H1117, as the ASCII value for ^W is 23 (&H17), not 7.
It may still work, but you should correct it.

> It works fine when sending CTRL-W to avserver, but it seems like
> THING never understands the AV_ACCWINDOPEN. Perhaps it is also worth
> mentioning that I use GFA and not C.

Well, _did_ you register via AV_PROTOKOLL (don't ask me why PROTOKOLL is
spelled German, whereas all other messages have English names)? If you
don't, Thing will simply ignore your windows. This is necessary because
in a multitasking environment, forgetting to unregister a window before
exiting (for example because the program simply crahses) would then lead
to confusion when another client with the same application ID gets
active.

Also note that Thing (nor any other AV server I know of) does not
directly top your window (this would be very bad style), but sends a
WM_TOPPED message to your application, just as if the user had clicked

into the window to top it.

Ciao

Thomas

Nope, this was not done before. Didn't realize it was necessary, even though I was going to add this call later to be sure what functions are supported. So, I guess that was the reason thing would care about the windows then.

```

I have HiSoft C Interpreter for sale, this allows you to write program
and try them out, just like you could in BASIC. It is not a compiler.

I also have Lattice C v5 & v5.6 for sale, use this in conjunction with
HiSoft's C interpreter so you can write, & test programs with one, and
then compile it when done.

I have also some other C packages. If you want to know more drop me a
line.

Greetings all,

I wonder whether or not it is possible to determine from within a
program what its own filename is? Is so, how?

Regards,

Joakim

This is what you usually find in argv[0], but I'm not sure whether
this is the case with TOS (I've never needed this). Anyone?

Hi Joakim!

JH>I wonder whether or not it is possible to determine from within a
JH>program what its own filename is? Is so, how?
Here's an extract from the Fcntl man page:
------------------------------- >8 schnipp 8<

Fcntl(2) Aug. 5, 1993 Fcntl(2)

NAME
Fcntl - perform various control operations on a file

SYNOPSIS
#include <filesys.h>

LONG Fcntl(WORD fh, LONG arg, WORD cmd);

DESCRIPTION
Fcntl performs various control operations on the open file
with GEMDOS file handle fh. The specific command to perï¿½
form is given by cmd; the possible commands are given by
symbolic constants in filesys.h, and are listed below.
arg is an argument whose meaning depends on the command.

The following commands are applicable to any file descripï¿½
tor:

[...]

PLOADINFO
Returns information about the parameters passed to
Pexec to start this process. arg should be a
pointer to a structure with the following format:
struct ploadinfo {
short fnamelen; /* length of fname field */
char *cmdlin; /* must point to 128 bytes, to be filled in
with the process' command line */
char *fname; /* must point to "fnamelen" bytes, to be
filled in with the full path+name of
the file from which the process was
launched */
}
The data pointed to by the structure elements will
be filled in with the appropriate data for this
process. If the process's full name and path are
too long to fit into the provided space, ENAMETOOï¿½
LONG will be returned. On success, a 0 is

returned.

[...]

RETURNS
0 or a positive number if successful (for most commands;
but see the specific descriptions above).

EIHNDL if fh is not a valid GEMDOS open handle.

EINVFN if the specified command is not valid for this file
handle

Some other (LONG) negative error number if an error
occurs; different commands may recognize different possii¿½
ble errors.

SEE ALSO
Fdup(2), Flock(2), Fopen(2), Fxattr(2), Pgetpgrp(2),
Psetpgrp(2)

BUGS
Very little error checking is done. In particular, ownerï¿½
ship of terminals is not properly checked, nor is
read/write access to the files. Do not rely on this bug;
it will be fixed some day.

File locking is not yet implemented for some file systems.

Hi Clair,

> How can I put a file into alphabetical order? I can't use external
> programs (I know of a program which can do it) because it's a PC
> program. (Spit)

The simplest of ways is to use a bubble sort routine. Basically, you go down
the list, comparing two entries at a time and if they are not in order then
swap them. You repeat this process until you make one complete pass of the
data where no swaps are needed, hence the data is sorted. I am not a great
basic expert but here is some pseudo-code for the algorithm.

loop
flag = 0
i = 0
loop
if string[i] > string[i+1] *
tempstring = string[i]
string[i] = string[i+1]
string[i+1] = tempstring
flag = 1
i = i +1
until i > max_data
while flag = 1

* How you compare the strings will depend on what functions are available in
basic. In C you would use strcmp(), but you may have to write your own
comparator. N.B. that you should ensure your function thinks A=a, unless you
require otherwise.

John.

Hi Martin,

> Was Hisoft C (compiler version) ever given away on a
> coverdisk? Is it worth finding anyway?

Lattice was never given away on a cover disk. It is well worth finding, it is by far the best commercial C compiler ever made. Unfortunately, it had a very limited distribution and Pure C is the most popular, however, it didn't find much support in the UK.

Given the choice I would opt for Lattice everytime, but if you plan to incorporate other people's libraries into your software, they are invariably written in Pure C and that is probably the software to go for.

> What about C++

Only one I know of is G++, from GNU, it's big and requires lots of memory.

John.

It's possible. MiNT uses it to determine if the memory protection should be
turned on or not (MINT.PRG or MINTNP.PRG). Have a look at the sources if you
have them (in boot.c or main.c or something like that).
If not, try
#include <osbind.h>
void main(int argc, char **argv)
{
Cconws(argv[0]);
Bconin(2);
}
and see what it prints ...
good luck

Hi Vincent!

VB>It's possible. MiNT uses it to determine if the memory protection
VB>should be turned on or not (MINT.PRG or MINTNP.PRG). Have a look at
VB>the sources if you have them (in boot.c or main.c or something like that).
It's in main.c. there also is a comment which explains how it works, but also
says why this should not be done by other programs:

```
-------------------------------- >8 schnipp 8<
--------------------------------
/* When executing AUTO folder programs, the ROM TOS locates
* all programs using Fsfirst/Fsnext; by peeking into our
* parent's (the AUTO-execute process's) DTA area, we can
* find out our own name...
* This works with all known (to me) TOS versions prior to
* MultiTOS; but I don't think any other programs should use
* this trick, since MiNT or another OS with memory protection
* could already be running! <mk>
-------------------------------- >8 schnapp 8<
--------------------------------
```

VB>If not, try

```
VB>#include <osbind.h>
VB>void main(int argc, char **argv)
VB>{
VB>Cconws(argv[0]);
VB>Bconin(2);
VB>}
```

AFAIK this also doesn't work everywhere too

I think there's no "global" solution to this problem

Bye

Joerg

If your program is passed the environment from the parent program,
which it should, then ARGV = "your program name" .
This is an environment variable.

This could get tricky if the program doesn't have any idea of the
environment it is running in??? If it does then that'll make things
much easier.

As Jo stated, argv[0] is the standard way for C programs. Sadly it
relies on the parent to set it correctly. Command shells do but
standard Gem/TOS will not - it'll be empty.

You got me curious.
I ran a small appliction to read program memory in TOS.
Text, Data, and BSS do not include program name.
Basepage and command line do not either.
Memory control blocks don't as well.
DTA does not.
Unless you have a parent program that passes in ENV, I don't think
you can know your program name, unless you code it to the program
itself.
Other than that, build a small general purpose program loaded that
you can run applications from, that will pass the child NAME.
Or, better yet, use something like Mint O/S and applications will have
an environment passed.

Hello,
I am learning to use C on the ST (Heat N Serve variety of Sozobon) for
a quicky job that just aches for a cheap ST. I've been meaning to do this
for a while; now I've got an excuse!

Anyways, my question involves slider controls. In Mircrosoft VC++,
these are easy; predefined dialog objects. They don't appear to be
predefined under GEM. How do you do sliders? My best guess at this
point is a headerless window with a vertical slide bar and nothing else,
which would have to be overtly constructed in code and placed on the
dialog. Is there a better way? (I hope...)

Hello again,
Second question: As long as I'm learning C and stumbling around with the object trees that the resource editor constructs, I've gotten some "free" resource editors, such as RSC30 and MKRS and ORCS, most of which (of course) are in German, and I'm playing around with them, but not extremely pleased. I've seen a commercial offering mentioned here, but can't remember the name. OR, if someone has a recommendation for a different "free" one that isn't present on Umich.

Also, these editors seem to focus on the monochrome screen. Given that "modern" TOS is usually in color, say, on a Falcon screen, are there resource editors to construct dialogs in color?

There's usually a solution. Taking into account I've been up all
night, off the top of my head ...

Newer Gem's could use appl_search using the ID gained from appl_init.
Command line progs get it anyway. Older Gem's virtually guarantee the
current working directory will be the same as the executable so you
could do worse than FsFirst(".*.xxx",FA_ARC | FA_RON) where 'xxx' is
the program's extender. There's the _PNAM environmental as well but I
can't for life of me recall the contexts in which it exists atm.

So roughly ...

```
IF argv[0] BLANK
THEN TRY appl_search
ELSE Do FsFirst
ENDIF
```

Needs enhancing by someone less sleepy of course! ;-)

By "dialogs" are we talking Windoze ones or Gem ones?

Gem ones are modal like Windoze ones with an important difference:
they are modal to the system. While *any* (ie "the only") dialog is
being displayed all other applications will grind to a halt at the
point they attempt to initiate changes to the screen (via the AES). A
dialog cannot receive messages so all other applications are blocked,
even in pre-emptive multitasking Gem operating systems!

Incidentally, this is why modern apps now place their dialogs into a
window: to let other apps can continue.

All that matters here is the question - is your dialog in a window or
is it a standard dialog? It's a bit difficult to answer below without
knowing.

> Anyways, my question involves slider controls. In Mircrosoft VC++,
>these are easy; predefined dialog objects. They don't appear to be

About all I can say atm is objects in the Gem OBJECT tree do not
possess their own handles: ie they are not capable of receiving their
own messages. It works more on the basis of

Gem keeps track of mouse
"what is under the mouse?"
message -> app
(possible) enquire object
app does something
app (probably) tells Gem to invoke visual changes.

Like I said, trying to explain both dialogs, in & out of windows, will
just lead in circles. ;-)

>resource editors to construct dialogs in color?

Yes, Interface.

You can put shading patterns to good use here. Design the initial resource in mono then load it in colour and change the colour values from BLACK to whatever. Mono resources will always display, reguardless of colour depth. Moreover, Gem will display anything which isn't in the background colour as BLACK if that colour does not exist in the current display rez. Even better, the mono colour indices map onto the 4 colour ones, and the 4 colour ones map onto the 16 colour ones. Ditto 256, the 1st 16 are the same.

Granted specifically designed resources look best but quite satisfactory results can be obtained via successive modifications to a mono resource.

If you don't know your program's file name, how would you know if
you have found the file with FxFirst. I guess you could read
Data,Text, and BSS of file tested to compare with your Basepage info.
appl_search no good until Tos 4.04.

In the long run, it would be a whole lot simpler for the programer
to code in the program name. After thinking about this, what purpose
would this have anyway.

2835. STinG in supervisor mode

Newsgroup: comp.sys.atari.programmer
Date: 1999-02-15 00:00:00 UTC
From: Henrik Gild&#65533; <di98gihe@ios.chalmers.se>
Message-ID: <36C8386A.C19C564C@ios.chalmers.se>
Source record: 3202

Hi!

I have programmed some network stuff that uses STinG. I have discovered
that, for some reason, STinG doesn't work properly when the computer
runs in supervisor mode.

In user mode, all works fine when calling CNbyte_count() for example.
But in supervisor mode the computer just freezes.

I read in the Atari Compendium that supervisor mode should be used
sparingly under MiNT, because no task switching can occur. Does this
apply to STinG too, and if so why?

Regards
/Henrik Gildï¿½

Do not call CNbyte_count() from supervisor mode.

>I read in the Atari Compendium that supervisor mode should be used
>sparingly under MiNT, because no task switching can occur. Does this
>apply to STinG too, and if so why?

If anything goes wrong when in supervisor mode
then the system halts.
Supervisor mode is only for the OS and device drivers.
So as you read in the Atari Compendium only use supervisor mode sparingly .

Martin Wilson (martin.w6@REMOVEukonline.co.uk) wrote:

: What freeware ones are available.

There are several:

- GNU C (GCC)
Very good, can generate code for just about any processor (so that
includes 030 code), does good optimizing.
Drawbacks can be the command line user-interface (you'll want to use a
shell like BASH with this), it't not really easy to install if you don't
know much about UNIX-oid systems, you'll probably need to have a MiNT
filesystem and it uses quite a lot of memory (at least 2 Mb needed for old
versions, 4 Mb for newer versions, but 14 Mb reccommended for serious use)

- Sozobon C, extended version
Pro's: Nice and small, produces compact code, fairly fast, will run on any
Atari machine, uses standard DRI object file format.
Cons: Not fully ANSI compatible, support for 32-bit ints is a bit buggy
(usually only a problem when porting UNIX stuff...), some of the GEM
bindings are a bit non-standard (again, only a problem when porting
other GEM code, sometimes...), no 030 optimization.

- Heat 'n Serve C and others.
Similar to Sozobon, not very well known... Some are proper ANSI though
and support the Sozobon libs.

: How much worse are they to commercial offerrings.

Usually not much, sometimes even better.
The biggest difference is the interface: commercial compilers all have a GEM
shell, the free ones only do commandlines.
Also, there are a lot of libs available for Pure C and Lattice C, these
can't be used with the other compilers if the source isn't available.
(although you could try disassembling them :-)
There are tons of code available for GCC though, mostly UNIX stuff.

: Which is fastest etc, least buggy, 68030 optimised?

Least buggy, probably: GCC (newer versions), and maybe Lattice C?
Fastest: Commercial compilers and maybe Sozobon

: What about C++

Only one option: GCC (or G++, actually). G++ is a _real_ memory-pig
though, and can be _very_ slow, even on a 75 Mhz Pentium...

: point is a headerless window with a vertical slide bar and nothing else,
: which would have to be overtly constructed in code and placed on the
: dialog. Is there a better way? (I hope...)

I doubt that the method you describe will work.
Slider bars are usually created out of various other objects (boxes,
buttons) and are handled manually by the application. This is tedious stuff,
I know...
I've been working on a modular non-modal GEM dialog lib for Sozobon C for a
while, which would make handling things like sliders and lists and dialogs
in general _a lot_ easier. I have had to stop development for a few months
due to other projects (ethernet-adapter driver) though...
If you want to know more about programming GEM studd, I suggest you read
"Professional GEM" by Tim Oren. It can be downloaded from my site
(atari.scum.org) or many atari FTP sites.

>been superceded now.

I got RSM a little while back. Can't remember the version number. It looks pretty good, does everything I would expect, EXCEPT how to save the .h file. There's a dialog for setting that capability, I think (dang, those German words are LONG!), but setting it, not setting it, and whatever I did to the "HRD" option got me a .hrd file, but never a .h file! Maybe that would have been a better question - how do I get a .h out of RSM? Without that, it's nice, but not too useful.

>knowing.

Yes. I discovered that re-reading the tutorial, so my direction right now is to put the dialog in a window. Which isn't really a dialog (in the GEM sense, I take it), but the graphic elements of the dialog drawn in the window. If this is the case, then the controls (like buttons and my sliders) aren't really controls, but objects being altered under program control as mouse messages are received.

While I'm asking, getting a dialog up on the screen is fairly well described in the literature. And getting text onto a window is fairly well described in some example source I've got. But how to put those graphical elements (described in the object tree) into a window - I could use a nudge in the right direction!

Message-ID: <7aafn0$28j$1@news.imaginet.fr>
Source record: 3212

Hello,

The CENTurbo II rev B will come, an update of the software package is
done:
CBOOT 1.1.0
CENTvidel 3.2.4
VIDEOMOD 1.2.2
CENTscreen 3.4.6
FLASH.BIN 1.2.6
Cecile demo 1.95

The new version correct some few bugs and bring a lot of new
functionnality notably
in CENTscreen. The last development of Dolmen make this soft to
evolve...

For the Phenix, a modification of the bloc diagram was achieved.

2846. Help Porting Pi Calculation program to Atari ST/Falcon!

Newsgroup: comp.sys.atari.programmer
Date: 1999-02-16 00:00:00 UTC
From: Dara Hazeghi <hazeghi@2xtreme.net>
Message-ID: <36C8F698.58B35C3A@2xtreme.net>
Source record: 3213

Hello All,
I have a program that calculates digits of the irrational number Pi by Carey Bloodworth. It's a great program and is the fastest program of it's kind currently available. I would like to make it available for as many platforms as possible including Atari ST/Falcon! Unfortunately I do not have access to a machine with Atari ST/Falcon on it or even one with a Atari ST/Falcon cross compiler. So I would very much appreciate it if someone running Atari ST/Falcon could compile the source and send the executables for me to post on the web.
The source is currently available at http://www.geocities.com/EnchantedForest/5815/pi_agm_src.tgz . Compiling it should be simple since it has already compiled under many OS's with no modifications. The only thing you need to do is compile the pi.c file. All the other (2) files are included from there. If you have cc you can just execute the build script. It would be very nice if the program could be compiled with some standard optimizations (like -O3) and the executable sent to me compressed in a standard compression format (like zip). I hope this is not too much to ask. Thanks in advance.

Dara Hazeghi
hazeghi@2xtreme.net

P.S. More information on the program can be found at http://www.geocities.com/EnchantedForest/5815/program.html .

!!

You are right, what funny behaviour. If you take an existing resource
file you cannot get it to produce a .H file when you 'Save As'.

However, if you are working with a new file it is produced OK.

There is an English translation if you want to go further. Look for
rsm211e.ZIP.

2851. Would like an assistant on a project (advanced lightingcontrolsystem)

Newsgroup: comp.sys.atari.programmer
Date: 1999-02-16 00:00:00 UTC
From: jesper.brannmark@swipnet.se
Message-ID: <36c9e882.116550@nntpserver.swip.net>
Source record: 3218

Hi.
My name is Jeppe and I just got my Atari up from my cellar (where it's
been the last 6 years or so).
I've used to do a lot of stuff in Gfabasic, and now I've started a new
programmingproject in Gfa.
My main interest is theatre and theatrelight (showlight), and therefor

I've stared just two days ago developing a software to control
showlighting.
Lighting tables is very expensive (from $1000 upto $40000).

My idea is to create a software that can control the same light an
normal size lighttable can (say like a normal $3000-class table).
This software uses MIDI and the MSC 1.01 protocol for superbe
light control.
The MIDI protocol also have features to control CD-decks, video-
projectors, advanced light (like motorised and such), colorchangers,
stroboscopes, haze, smoke, moving lights (like discostuff).

The program I started with is a simple lightcontrol for Atari
ST-computers, that can be compared to that $3000-table.
You can get the Atari for $100-200 with monitor today and
the software can be sold cheep - thatway Atari can compare
to large advanced and EXPENSIVE systems.

It's terrible boring to do this by my self and never get any great
feedback.

I would like to get in contact (by email) with someone that is
good at GFA. I know all about MSC-protocol and lighting, and
a lot about GFA.
So no knowledge of MSC or digital lightingprotocols is
needed, just the extra GFA help.

2852. IEEE 1394 cards

Newsgroup: comp.sys.atari.programmer
Date: 1999-02-16 00:00:00 UTC
From: peter.slegg@zetnet.co.uk
Message-ID: <7acq12$3l0$1@irk.zetnet.co.uk>
Source record: 3219

Hi,

I'm not sure how to start this question.

Has anyone heard of the IEEE1394 interface (aka Firewire) ?

It is a new type of high-speed peripheral interface capable of very high data speeds, I think the design is capable of 250Mb/s.

The interface is also flexible, allowing many devices to be connected and daisy-chained (~125) and cable lengths can be long (~4.5m)

Oddly the first devices to use this interface have been digital cameras, both still and video. It can of course be used on hard-disks, CD-ROMS, DVD, video, etc., etc.

One of the first applications has been video editing. From a digital video camcorder the image & sound data can be uploaded onto a fast hard-disk (~3.5Mb/s). Using software, the image sequences can then be edited like on a traditional edit desk and the resulting edit can then be downloaded onto a fresh digital video tape in the original camcorder (or any other IEEE1394 device).

All this sounds wonderful to someone like myself who has spent days with an edit desk, a camcorder, a VHS deck and dozens of cables.

Alas, this interface was designed by Apple so they were the first to offer it on their computers. However, there are now PCI - IEEE1394 cards available from companies such as Adaptec suitable for the Milan, Mac and pc.

There is even a TOS based editing suite available called Mountain from France (TNT), sadly it doesn't handle sound yet.

The only item missing from the jigsaw is the driver necessary to handle the PCI-IEEE1394 card.

I must confess at this point that I write software for a living but I have never got to grips with the Atari (typical isn't it) and I wouldn't know where to start to write a device driver. I guess some specs. are needed or maybe some sample code from the manufacturer.

I am hoping that some of the experts out there may take this on as it seems a natural extension to the HD device drivers and CD ROM drivers.

Is anyone interested ?

regards,

Peter.

> these are easy; predefined dialog objects. They don't appear to be
> predefined under GEM. How do you do sliders?

Make two touchexit buttons in your dialog box, these will be your up and down scrollers. You can get the arrow charactes by pressing CTRL and I think A for up and B for down. For the slider part make one box for the outline and another as the actual slider, put the slider box inside the outline. Now align these up so they look nice in the resource editor.

In your program, simply adjust the size and position of the slider box as appropriate.

John.

You can look on my webpages for some GFA utilities I have made or some I have posted that were made by others. I don't really have time to take on other projects as I have too many going already. However I can maybe give advice or tips about GFA-Basic itself, since I use it alot.

On 16 Feb 1999 22:06:13 , Jeppe Br&#65533;nnmark wrote:
>I would like to get in contact (by email) with someone that is

Peter Slegg (peter.slegg@zetnet.co.uk) wrote:

: The only item missing from the jigsaw is the driver necessary to handle the
: PCI-IEEE1394 card.
: I must confess at this point that I write software for a living but I have
: never got to grips with the Atari (typical isn't it) and I wouldn't know
: where to start to write a device driver.

You'll need at least some info on PCI interfacing for the machine you want
to use (a Milan, was it?). The manufacturer should be able to provide you
with those.

: I guess some specs. are needed or
: maybe some sample code from the manufacturer.

Yes, you'll need that as well. You can also check if device drivers exist
or are being developed for Linux, you could use some of that code (only if
you release the driver under GPL)

Most drivers on the Atari are implemented using a "cookie", which points to
a structure which can contain version numbers, values and pointers to
interface functions which can then be used by other programs or higher-level
drivers. Examples of cookie use can be found for instance in the CBHD SCSI
driver package.

The levels could look something like:

1. PCI interface driver (this one probably already exists)
2. IEEE1394 card driver (which uses the level 1. PCI driver)
3. Video/HD/transfer/network/etc. driver, which uses... etc.
4. User software

: I am hoping that some of the experts out there may take this on

Hope so too. :-)
I'm already busy writing a device driver for another type of device...

: as it seems a
: natural extension to the HD device drivers and CD ROM drivers.

: Is anyone interested ?

: regards,

: Peter.

>use a nudge in the right direction!

All the positions of the objects in a tree are relative co-ordinates, so to position the tree in a window all you need do is modify the co-ords of the tree ROOT object so they match those of the window work area (WF_WORKXYWH). eg AES moves window ...

You catch WM_MOVED. The message buffer will have WF_FULLXYWH in it. Convert this to WF_WORKXYWH, either by wind_get(WF_WORKXYWH), or calculate it directly via wind_calc(). Set ob[ROOT].ob_x,ob[ROOT].ob_y to the x,y co-ords from WF_WORKXYWH.

Now these changes need to be made visual. Either call your window redraw code directly, or (as I prefer) have your app send itself a WM_REDRAW message for that window.

The redraw code needs to do the usual WF_FIRSTXYWH,WF_NEXTXYWH stuff where you simply use objc_draw over and over again until you've "walked all the rectangles". The clipping rectangle for objc_draw is that returned by WF_FIRSTXYWH,WF_NEXTXYWH. You've finished walking when you get a clipping rectangle with zero width and height.

User interaction with the dialog is a little trickier. It'll need to be handled by evnt_multi() and you'll be looking at the MU_BUTTON

event initially (MU_KEYBD as well later). When an MU_BUTTON occurs do an objc_find() using the mouse co-ords. As to what you do with the object under the mouse is entirely up to you!

Implementing the editable fields is a pita. I suggest that be left to one side for a while.

Why not take a look at WDialog
http://home.t-online.de/home/ToBeHome/Software.html

The archive includes some good example code aswell.

I can't say that I've used it yet myself, but it looked well thought out.

Later,
Karl.

There is a lot of software around to convert from one picture format
to another.

I use 800 x 600 pixels true-color compressed TARGA pictures.

I want them on the home-page.
The are about 1 Mb each, so that is a no-go.

First I have to convert them to something like JPEG or PNG or
whatever that is in fashion nowadays.

But I stll end up with big files. And with to many pixels when they
come on-screen.
I need something of 100 x 75 pixels on the www-page.

Is there software to change (reduce) the number of pixels in a
picture?

Met vriendelijke groet,
Ronald van der Kamp

After extracting the files sozbin14.zoo, sozbin15.zoo, sozlib15.zoo, sozutil09.zoo, sozc6844.lzh and mntsox44.zoo I set the following environment variables:

```
PATH=C:\SOZDISTR\BIN\
SOZBIN=C:\SOZDISTR\BIN\
LIBDIR=C:\SOZDISTR\LIB\
INCLUDEDIR=C:\SOZDISTR\INCLUDE\
```

Compilation of test.c ...

```
#include<stdio.h>

int main()
{
printf("Hello, world!\n");
return 0;
}
```

... shows that my Installation of Sozobon-C cannot find stdio.h!

Did I install the wrong files / versions or are there some more env-variables to set?

Thanks for help, Didi.

Could be all manner of reasons.

>In user mode, all works fine when calling CNbyte_count() for example.
>But in supervisor mode the computer just freezes.

It's best to keep your program in user mode all the time. Just shift
to superstate only when necessary, then revert back.

>I read in the Atari Compendium that supervisor mode should be used
>sparingly under MiNT, because no task switching can occur.

None of the Atari operating systems (to my knowledge) will multitask
whilst the system is in superstate. Offhand I've a vague recollection
the AES can't be called from superstate either.

>Does this
>apply to STinG too, and if so why?

Interrupts. Atari more or less decided they could mess with them as
they pleased while the cpu was in superstate.

Sounds like the most probable cause is an incorrect environmental
variable. Wild guess - INCDIR.

>way I want: pixel reducing!

It is possible to reduce the picture size. Under the 'Extra' menu select 'Preseting'. Enter the scaling, e.g.. for 640x480 to 64x48 enter for (X) 10 and for (Y) 10 and click okay. Then under the 'File' menu select 'Not Show'. This will ensure that when you open the picture it will save it back out at the reduced size in the default format for the colour depth.

To alter the default, select 'Saving Dflt' under the 'Extra' menu. Clicking on the format produces a dialog box where you can pick the required format. When you've selected the required formats, close the dialog and load in the picture required. Gemview will then load it in, reduce the size and save it back out again.

2879. RARE? ATARI BASIC

Newsgroup: comp.sys.atari.programmer
Date: 1999-02-23 00:00:00 UTC
From: Bowling <mbowlin1@tampabay.rr.com>
Message-ID: <oeqA2.202$85.321342@newse3.tampabay.rr.com>
Source record: 3245

There are THREE versions of Atari BASIC Computing Language, as follows:
Atari CXL4002 79 BASIC Computing Language [ver. A] C
Atari CXL4002 ?81 BASIC Computing Language [ver. B] ER
Atari CXL4002 85 BASIC Computing Language [ver. C] R
One of my BASIC carts is not dated, but instead has "R 39 2" stamped (you know, "recessed") into the front of the cart (in very small letters). How can I know if it is the version "A" (common) cart, or if it is the version "B" (Extremely Rare) cart? I also definitely own a copy of the version "C" cart, because the DATE is written on the label, but I am curious whether my other BASIC cart is version "A" or version "B".
Does anyone know how I can find out? Is there a "command" I can type that will tell me the VERSION of my unidentified BASIC cart?
Thanks,
--MB

I have here a Imagecopy 2 and there is nowhere in the options
something to reduce the number of pixels from say 640 x 480 to 64 x
48 and save it in whatever pictureformat.

A GemView version 3.1 also can convert to many formats but not in the
way I want: pixel reducing!

There is an adaptor you can buy called AT Keys (I think). It's
a while a go since I read about this device but I think it
replaces or at least overrides the Atari keyboard controller
and allows you to connect PC keyboards.

At Keys is available from System Solutions

http://www.system-solutions.co.uk/cafe

I'm still working on my DLL manager for TOS that I mentioned in this newsgroup a year or two ago.

It is almost ready for alpha release, however I still have a bit left to do on the user manuals (the programmer manuals for the engine, and how to write a library are OK).

(I'd intended to have it released mid/late 1998, but some restructuring and optimisations delayed this)

As well as being a librarian, it has some non-library functionality - like manipulating the cookie jar, getting TOS info, getting info about the computer it is running on (RAM/CPU) and so forth.

Are there any features that you would like to see in this or a future version?

ATM there are functions to detect if a library is already loaded, to load and unload a library, to "link" to an already loaded library, to enumerate all current libraries, get info about an on-disc library, and to test a library (to see if it is "ok")

It can handle about 40 loaded libraries (based on a unique library name - when you add links to already loaded libraries this figure increases to many hundreds). This figure (40 physical libraries) will be raised in the future if/when I get around to capacity-torturing it.

The Toolbox consumes 32k of disc. and 32k of RAM plus whatever memory the libraries require.

--

All email sent to my inca address will fail, however I can now be contacted via an intermediary : gem at tos pl net. I would like to apologise to the genuine respondents that this may inconvenience.

If you want to do something with a picture that doesn't include
actual drawing, chances are good MGIF (FreeWare) will do it (and often
faster than the alternatives ;-).

When it comes to scaling, you have a choice of filtered or unfiltered
(you could apply a smoothing filter beforehand too if you want), so it
should work fine for you.

MGIF loads GIF, Targa, JPEG and a few other formats and will save as
for example GIF or Targa (currently not JPEG, though).

I think the apeface he is referring to is the old SIO to Parallel Printer interface. You connect the Atari8 SIO port to a standard IBM-compatible parallel printer. I used to have an Epson RX-80 w/graftrax connected to my 800xl via an Apeface. I used to print nice stuff to it through the old G: device driver thing. I still have this gdevice software around here if you have an Epson printer.

OB_FLAGS(tree%,obj&)=BSET(OB_FLAGS(tree%,obj&),x)
OB_FLAGS(tree%,obj&)=BCLR(OB_FLAGS(tree%,obj&),x)

resp. to set the bit x in the flag for the object number obj& in the
tree number tree%, and to clear the same bit.

(I'm just beginning to play with those things :-))

Bye,
/Pascal/

From: dlormand@aztec.asu.edu
Message-ID: <7b6sl2iur1@news.asu.edu>
Source record: 3118

Thanks for all the great help on sliders and resource editors! I've got some sliders working, and a big step up on my project.

Got some more questions, though...

1. Are there undocumented function calls in the GEMfast library?
In the AES documentation in the Compendium, the description of wind_create is something like
wind_create(int type, int x, int y, int w, int h);

In the example source that came with H&S, however, it is
wind_create(int type, GRECT xywh);

Is this actually a different call (in which case the GEMfast implementation of wind_create is not documented), or does GRECT just happen to get stacked in the xywh order?

2. Now I'm ready for the real work. Serial (aux) port: Call Bconout to transmit a byte. The external device handshakes, so loop on Bconstat until something arrives, then call Bconin and mask off the LSB. How far off am I?

Then I see the Iorec function, which makes me wonder if the system doesn't pull bytes off the port and put them into a buffer automatically. Or even, you put outgoing bytes into a buffer and the system transmits them for you. The explanation in the Compendium is awful light. With the handshaking that this protocol involves (for the most part) and the small amounts of data being transferred, I don't really want to set up an ISR.

The answer lies in the problem ...

>Why?

... you can manipulate the OBJECT directly all you want but no visual
changes will be seen until *something* causes the object to be
redrawn. Closing and reopening the window initiates a WM_REDRAW. Thus,
you should perform your changes then send yourself a WM_REDRAW.

Incidentally, to speed things up a little you might consider a
WM_REDRAW clipped to the object you've changed but note that things
extending outward of the ob_x,ob_y,ob_width,ob_height area of an
object can become a headache. Tip: find the object's parent and redraw
clipped to *it* plus its children. ;-)

>

I don't think you understand the work "compile".

The code

```
PRINT "This is basic code"
PRINT "Press a key to exit."
~INP(2)
STOP
```

is GFA Basic code. When you save it, TOS cannot and willnot understand
it. Only GFA Basic will.

In order to make it executable code (TOS will run it in) you need to
compile it. I personnaly use Minuq Tranquille - it's postcardware and
very good. (Get it on good programming CDs/Disks) - although GFA have
released their own compiler.

You cannot uncompile executable code, but it can be passed on without
any other file.

The GFA editor actully DOES compile it into memory, so you can test it.
It is no quicker than it takes to compile normally. It's the writing to
the disk which takes time. (If you use minuq tranquille, then you'll
notice it says "Passed test 1" through to "passed test 3"
test 1 is checking it exists, and that it'll load into memory (It does
it)
test 2 is compiling it into memory
test 3 is writing the finished product to disk.

I know this isn't REALLY programming, or Atari, but when you think about
it, it is...

Is there any way of clearing the frames in a web site in the anchor tag?

Yes, of course, and this has always been done from within the code.

>
>Is this actually a different call (in which case the GEMfast implementation
>of wind_create is not documented), or does GRECT just happen to get stacked
>in the xywh order?

GRECT is ...

```
typedef struct {
int g_x,g_y,
g_w,g_h
} GRECT;
```

MWC uses ...

```
typedef struct {
int x,y,
w,h;
} Rect;
```

... but they're both the same thing: same size structure: same components etc.

Yes. You are correct about the stacking. Standard C stacks arguments right to left, so those int's get pushed 'h,w,y,x'. Thus they end up with 'x' at the lowest memory address, which matches the storage of the GRECT on the stack ...

```
GRECT g;
SP -= sizeof(GRECT);
*SP = g; /* ie memcpy(SP,&g,sizeof(GRECT)); */
```

Incidentally it'll work elsewhere ...

```
Rect r ={1,2,3,4};
printf("%d %d %d %d\n",r);
```

... saves a fair bit of typing for those debugging statements!

Tbh the disks are pretty useless without the book. I've been using MWC
for over a decade and still refer to it. Besides, a concerted effort
sometime back failed to find anybody who had the copyright. There's
been the odd posting in usenet from one or two who used to work there:
apparently many sources got corrupted.

The compiler Minuq Tranquille that you speak of is in fact not a real compiler but a clever hack of the gfa-basic runtime program. You think it's compiled but what it really does it append the runtime program directly to your source code. In fact if you was to give me a program compiled with this so called compiler I can extract your source code from it intact. I'm not joking here I have investigated this free compiler. If you get the real compiler from GFA your programs will run some magnitude faster!

>You cannot uncompile executable code, but it can be passed on without
>any other file.

See above, I can if you use that fake compiler! Send me a compiled program I will send you back your source code if you don't believe me. ;-)

>The GFA editor actully DOES compile it into memory, so you can test it.

The editor does not compile, it runs the program interpreted, meaning each basic token is looked up on the fly and some asm code is executed.... this is slow. Compiling it will change the entire file into all asm and the tokens will be gone, thus it's faster.

From: dlormand@aztec.asu.edu
Message-ID: <7bee95$37s$1@news.asu.edu>
Source record: 3130

Got the bit with RS232 figured out. The Rsconf documentation was a little
off; it says it returns the ucr/rsr/tsr/scr in a packed longword with
ucr in the MSbyte; in actuality, ucr came out in byte 1 (second LSB).

Incidentally, yes, I know using Bconin/Bconout/Bconstat is low-level, but
it should be portable, and I couldn't figure how to do a timeout waiting for
input. All the high-level input functions (e.g. fgetc) will wait forever
for a character to arrive, and there is no such thing as EOF for stdaux.

Got another:

I start a (standard) dialog, in this particular case with the easy
frm_dialog function in the GEMfast libraries. Comes up, I can punch
the buttons, and things work right. However, I have some radio buttons
and edit fields that I want to update and redisplay without dismissing
the dialog. I can successfully select buttons and copy strings to objects,
evidenced by what I see if I call the dialog up again, but I can't redraw
the dialog while it is still up. objc_draw executes and returns "no error,"
but the screen is unaffected. What am I doing wrong?

This is what I'm experiencing, too, I think. Is this for dialogs?
If I draw my object tree in a window, I can update the objects
(individually or collectively) any time. But if I create a dialog,
I can't redraw objects; new settings appear only if I dismiss the
dialog and call it back up again.

AESglobal[1] (I don't know what it's called in GFA) contains the number
of possible concurrent applications. If it's -1 (MultiTOS, N.AES) there's
no limit.

No, this was for objects in windows.

When eg. changing an object from default on to default off, I hadn't realized
I had to redraw from parent object to make it visible that the default border
was gone. Now works fine! :)

It was originally released by Borland Germany as Turbo C. The programmers then broke it off from Borland, renamed it Pure C, and sold it through Application Systems. It is no longer being made, however.

```
multitask!=WORD{{GB+4}+2}<>1
that's all :) should do it.

Here some extra:

deskacc&=({ADD(BASEPAGE,36)}=0) ! if your app is an acc
compiled!=BYTE{BASEPAGE+256}<>96 ! if your app was run from editor,
! or was compiled.
function aes$
local a$,a&
a$=HEX$(DPEEK(LPEEK(GB+4)))
return a$
endfunc

ap_id&=APPL_INIT()
if ap_id&=-1
error do whatever
~APPL_EXIT()
endif

if deskacc&
print "was ran as acc"
else
print "was ran as prog"
endif

Extra hint: don't use the GFA builtin commands, 3/4th of them are
buggy.(at least)
don't use the line-a calls, and don't use the menu_register() of GFA, or
even exist()

Hope this helps.

Hello,

does anybody know about an image format with the extension .64k??
I have loads of medical MR-images I would like to convert but I am not
even able to see them, because I lack a viewer for these images.

Is this any "official" data format, or is it something created by an
individual for his personal use? In other words, has anybody ever heard
of this format?

Thanks a lot,

Uli

PS: please respond by personal mail, too

Cross-posted to: comp.games.development.programming.misc,comp.sys.mac.programmer.games,alt.msdos.programmer,comp.os.msdos.programmer,comp.programming,,comp.sys.amiga.programmer,comp.sys.atari.programmer,

Hello,

I would like to hear some opinions on the following :

I've often wondered what will eventually remain of all
older/early games, tools, operating systems, ... that once
enjoyed users of Sinclair, Atari, Amiga, Commodore, ... ?
Even the first releases of OS/2, Photoshop or whatever would
be a waste if never to be available anymore.

Even if most of them are already long forgotten and maybe even
not available anymore, there are certainly several issues when
this software would be freely distributed.

There is the matter of copyright of course.

Secondly some minor groups are still selling this older software.
Their offer however is often very, very limited and it is by far
not always clear what the origin of the software is.
Despite these efforts I'm afraid a lot of software already
can only be found in diskboxes in some people's attic.
If would in fact be very strange if version 1.x would endanger
the sales of version 3+ of whatever.
Recently 1.x versions of several of Borlands development tools
were included with some magazines... .

Third issue are the developers. Distributing this old software
is said to discourage them of writing new software. Boy, those oldie
sure were very good ! With some very good emulators today, it could
on the contrary be catchy to write some new stuff.
If available, the source of some oldies could also be interesting
material
for debuting developers in my opinion (anybody from Argonaut still out
there ?). Curious what Linux and Be porting teams would make of
the code of oldies (Dan Bricklin's Visicalc remastered ;-)))).

It would already be a nice if some of the companies still in business
released their older versions (wonder whether Sierra still has King's
Quest 1 for the Atari in their cellar ;-))).
What about companies that already vanished over the years ?

Geert

2928. Looking for info ATARI SLM804 laser printer

Hi,

Is there anybody who has some info about this printer ? I have one now but I
have to know more...
Do I need drivers for this printer to connect it to my ST ? Maybe someone
has a manual for me...

Thanx,
Rene

If you are looking at my old GFA program mtosname (or something
along those lines). Then yes that is addressing the global array to detect
if you are running under multitos (as per the standards of the day, when I
wrote it). With a map of the global array and that, you should be able to
get anything you need.

Copyright lasts author's life + 75 years. Every old video game
falls under that, and copyright has NOT been lost due to
age. "Abandoned" is a meaningless term, as copyrights do not get lost
due to being 'abandoned'. [Trademarks can be lost if undefended, but
that's a different legal concept.]

The creator of something has full control over their product, the
audience has NONE. Get that into your mind, learn it, deal with it. If
a sculptor says that their creation will be shown for a month at
museum X, and then it'll be destroyed, THAT'S THEIR RIGHT TO DO SO. If
a software company wants to never support or re-release something
after its initial printing, THAT'S THEIR RIGHT TO DO SO. You have no
right to argue with them, you have no rights to think better than them
and decide how something should be distributed.

You want something to be available some years after it's released?
Write it yourSELF, and put it under a license to freely copy. Get off
your rear and start creating, instead of only lying about old titles.

Source record: 3054

Hi!
I have gathered team that's working on a Atari Jaguar shoot 'em up game.
Although the team looks quite good as for now, I am still looking for more
skilful members. There are few spots for:

-Programmers(C & ASM)
-Graphic artists(2D or 3D, raytracing, modelling, painting etc.)
-Sound editors and musicians

I don't think I am able to pay you anything, but if you want to be a part of
Jaguar's history, want to develop for a 64-bit machine, contact me.
Also, I'm sure this would help in future getting job in industry.

E-mail your applications to me, ville.jarvi@pp.inet.fi

Thanks!

Can an artist not destroy what he is unsatisfied with, while working on
something better? A game designer may feel that the first game was inferior
to a sequel or a later similar game, and want to remove it as something which
spoils the later work.

In the case of "The Great Space Race" (Legend, 1983), this is clearly a
Good Thing.

> Some program however no longr have to
>copyrights on them and are listed as abandonware.

Bollocks. There's no such legally-recognised system.

The original copyright holders may waive their rights to the game *if
asked first*, but this only converts the product to "Public Domain".
Other copyright holders may require that the "Freeware" concept be
used, where they still retain copyright, but waive any and all charges
for the game.

Yet other copyright holders will say "no" - especially if they're
persuing a possible sequel or update, or merely consider the game's
release detrimental to their career prospects. In these cases, any
copies of their software doing the rounds on the Internet are
illegal.

Others have had their software uploaded to the Internet without their
knowledge or permission. This is also illegal.

"Abandonware" is a portmanteau term used to denote software that
computer game 'archeologists' believe to be unavailable from any source
other than licensed owners of copies of said game. And which they
believe should be considered 'Public Domain'.

These people are not infallible. In 99% of cases, the copyright holders
can be tracked down after some effort, but it is not incumbent on the
copyright holder to make him or herself available for this purpose at
all times.

It should also be borne in mind that official museums for computer
games do exist. The British Film Institute maintains one near it's
Museum Of the Moving Image site on the South Bank complex in London.
And these places would far rather see the original software in its
original packaging; a feature that makes more sense for most

researchers, since they get to see the product in context.

Neither is there anything inherently wrong with preventing further distribution of a product. Just because I released my game once, it is not incumbent on me to release it again at a later date. Copyright means it is my right to do with my game as I damned well please. Whether you like it or not.

It's also worth bearing in mind that piracy and cowboy publishers were a massive problem during the 8-bit and 16-bit eras. Because of this, copyright holders of 8-bit and 16-bit games tend to be wary of people asking them to just give their software away for free. (Especially when so many people did this anyway.) Because of this, some of the greatest 8-bit programmers are now working in offices writing database software and the like. It may not be as much fun, but at least they're getting paid top dollar for their skills.

I have part of an 8-bit game's copyright, and a 16-bit game's copyright to my name, both of which are utterly forgettable. (The latter made the front cover of ST Format, but this was when the Atari was already dying off.)

I personally consider the 8-bit game to be dire - especially as it was published before we'd finished it. I am not interested in seeing either of them 'preserved'. If you want my rights to my games that badly, you can pay me for them. Otherwise, live without. You're not missing much.

> By the way, what is
>argonaut?

Argonaut Software is owned by Jez San. They are based somewhere in North London (last time I looked), and are still a going concern.

They started out with Starglider for the Atari ST and Commodore Amiga. Later, they moved into consoles and were the designers responsible for the SNES' "StarFox" game (using a custom-designed 3D processor in the cartridge). More recently, they created a few lacklustre PC games, and are still involved with Nintendo.

I wrote a Year 2000 Countdown Clock program, but I would like to use the LCD digits that are located in the ASCII table at positions 16 through 25. Is there a way to print these characters to the screen? When I use PRINT CHR$(16) instead of printing the LCD 0 digit it does some sort of control function. Please give me a listing showing an example of how to print these digits to the screen. Maybe I have to load a different set of screen fonts, or do some sort of offset?

There you have this beautifull razorsharp modern screens, and you want
to stick to those early primitive mechanical operated 7 point
